

# PM0045 Programming manual

# Signal processing engine (SPE) APU programming interface manual

#### Introduction

The primary objective of this manual is to help programmers provide software that is compatible across the family of processors that use the signal processing engine (SPE) auxiliary processing unit (APU).

#### Scope

The scope of this manual does not include a description of individual SPE implementations. Each PowerPC™ processor is unique in its implementation of the SPE.

#### **Audience**

This manual supports system software and application programmers who want to use the SPE APU to develop products. Users should understand the following concepts:

- Operating systems
- Microprocessor system design
- Basic principles of RISC processing
- SPE instruction set

The major sections of this manual provide a general understanding of what the programming model defines in the SPE APU.

It is useful for software engineers who need to understand how to access SPE functionality from high level languages such as C and C++.

It will describe all instructions in the e500 core complex as well as Book E instructions that are defined for 32-bit implementations, along with data manipulation, SPE floating-point status and control register (SPEFSCR) operations, ABI extensions (malloc(), realloc(), calloc(), and new), a printf example, and additional library routines.

Examples are given of valid and invalid initializations of the SPE data types.

Overview PM0045

### 1 Overview

This document defines a programming model to use with the signal processing engine (SPE) auxiliary processing unit (APU). This document describes three types of programming interfaces:

- A high-level language interface that is intended for use within programming languages, such as C or C++
- An application binary interface (ABI) that defines low-level coding conventions
- An assembly language interface

## 1.1 High-level language interface

The high-level language interface enables programmers to use the SPE APU from programming languages such as C and C++, and describes fundamental data types for the SPE programming model. See *Chapter 2: High-level language interface on page 15*," for details about this interface.

## 1.2 Application binary interface (ABI)

The SPE programming model extends the existing PowerPC ABIs. The extension is independent of the endian mode. The ABI reviews the data types and register usage conventions for vector register files and describes setup of the stack frame. Save and Restore functions for the vector register are included in the ABI section to advocate uniformity of method among compilers for saving and restoring vector registers.

The AltiVec<sup>™</sup> Technology Programming Interface Manual, provides the valid set of argument types for specific AltiVec operations and predicates as well as specific AltiVec instructions that are generated for that set of arguments. The AltiVec operations and predicates are organized alphabetically in Chapter 4: Additional operations on page 295"

## 2 High-level language interface

#### 2.1 Introduction

This document defines a programming model to use with the signal processing engine (SPE) auxiliary processing unit (APU) instruction set. The purpose of the programming model is to give users the ability to write code that utilizes the APU in a high-level language, such as C or C++.

Users should not be concerned with issues such as register allocation, scheduling, and conformity to the underlying ABI, which are all associated with writing code at the assembly level.

## 2.2 High-level language interface

The high-level language interface for SPE is intended to accomplish the following goals:

- Provide an efficient and expressive mechanism to access SPE functionality from programming languages such as C and C++
- Define a minimal set of language extensions that unambiguously describe the intent of the programmer while minimizing the impact on existing PowerPC compilers and development tools
- Define a minimal set of library extensions that are needed to support SPE

### 2.2.1 Data types

*Table 1* describes a set of fundamental data types that the SPE programming model introduces.

Note:

The type \_ev64\_ stands for embedded vector of data width 64 bits.

Table 1. Data types

New C/C++ type	Interpretation of contents	Values	
ev64_u16	4 unsigned 16-bit integers	065535	
ev64_s16	4 signed 16-bit integers	-3276832767	
ev64_u32	2 unsigned 32-bit integers	02 <sup>32</sup> - 1	
ev64_s32	2 signed 32-bit integers	-2 <sup>31</sup> 2 <sup>31</sup> - 1	
ev64_u64	1 unsigned 64-bit integer	02 <sup>64</sup> - 1	
ev64_s64	1 signed 64-bit integer	-2 <sup>63</sup> 2 <sup>63</sup> - 1	
ev64_fs	2 floats	IEEE-754 single-precision values	
ev64_opaque	any of the above	_	

The \_\_ev64\_opaque\_\_ data type is an opaque data type that can represent any of the specified \_\_ev64\_\*\_ data types. All of the \_\_ev64\_\*\_ data types are available to programmers.

#### 2.2.2 Alignment

Refer to the e500 ABI for full alignment details.

#### Alignment of \_\_ev64\_\*\_\_ types

A defined data item of any \_\_ev64\_\*\_\_ data type in memory is always aligned on an 8-byte boundary. A pointer to any \_\_ev64\_\*\_\_ data type always points to an 8-byte boundary. The compiler is responsible for aligning any \_\_ev64\_\*\_\_ data types on an 8-byte boundary. When \_\_ev64\_\*\_\_ data is correctly aligned, a program is incorrect if it attempts to dereference a pointer to an \_\_ev64\_\*\_\_ type if the pointer does not contain an 8-byte aligned address.

In the SPE architecture, an unaligned load/store causes an alignment exception.

#### Alignment of aggregates and unions containing \_\_ev64\_\*\_\_ types

Aggregates (structures and arrays) and unions containing \_\_ev64\_\*\_\_ variables must be aligned on 8-byte boundaries and their internal organization must be padded, if necessary, so that each internal \_\_ev64\_\*\_\_ variable is aligned on an 8-byte boundary.

#### 2.2.3 Extensions of C/C++ operators for the new types

Most C/C++ operators do not permit any of their arguments to be one of the \_\_ev64\_\*\_\_ types. Let 'a' and 'b' be variables of any \_\_ev64\_\*\_\_ type, and 'p' be a pointer to any \_\_ev64\_\*\_\_ type. The normal C/C++ operators are extended to include the operations in the following sections.

#### sizeof()

The functions sizeof(a) and sizeof(\*p) return 8.

#### **Assignment**

Assignment is allowed only if both the left- and right-hand sides of an expression are the same \_\_ev64\_\*\_\_ type. For example, the expression a=b is valid and represents assignment of 'b' to 'a'. The one exception to the rule occurs when 'a' or 'b' is of type \_\_ev64\_opaque\_\_ and let 'a' be of any \_\_ev64\_\*\_\_ type.

The assignments a=o and o=a are allowed and have implicit casts. Otherwise, the expression is invalid, and the compiler must signal an error.

#### **Address operator**

The operation &a is valid if 'a' is an \_\_ev64\_\*\_ type. The result of the operation is a pointer to 'a'.

#### Pointer arithmetic

The usual pointer arithmetic can be performed on p. In particular, p+1 is a pointer to the next \_\_ev64\_\*\_\_ element after p.

#### Pointer dereferencing

If 'p' is a pointer to an \_\_ev64\_\*\_\_ type, \*p implies either a 64-bit SPE load from the address, equivalent to the intrinsic \_\_ev\_ldd(p,0), or a 64-bit SPE store to that address,

16/315 Doc ID 13881 Rev 3

equivalent to the intrinsic \_\_ev\_stdd(p,0). Dereferencing a pointer to a non-\_\_ev64\_\*\_\_ type produces the standard behavior of either a load or a copy of the corresponding type.

Alignment of \_\_ev64\_\*\_\_ types on page 16, describes unaligned accesses.

#### Type casting

Pointers to \_\_ev64\_\*\_\_ and existing types may be cast back and forth to each other. Casting a pointer to an \_\_ev64\_\*\_\_ type represents an (unchecked) assertion that the address is 8-byte aligned.

Casting from a integral type to a pointer to an \_\_ev64\_\*\_\_ type is allowed.

For example:

```
__ev64_u16__ *a = (__ev64_u16__ *) 0x48;
```

Casting between \_\_ev64\_\*\_\_ types and existing types is not allowed.

Casting between \_\_ev64\_\*\_\_ types and pointers to existing types is not allowed.

The behaviors expected from such casting are provided instead of using intrinsics.

The intrinsics provide the ability to extract existing data types out of \_\_ev64\_\*\_\_ variables as well as the ability to insert into and/or create \_\_ev64\_\*\_\_ variables from existing data types. Normal C casts provide casts from one \_\_ev64\_\*\_\_ type to another.

An implicit cast is performed when going to \_\_ev64\_opaque\_\_ from any other \_\_ev64\_\*\_\_ type. An implicit cast occurs when going from \_\_ev64\_opaque\_\_ to any other \_\_ev64\_\*\_ type. The implicit casts that occur when going between \_\_ev64\_opaque\_\_ and any other \_\_ev64\_\*\_\_ type also apply to pointers of type \_\_ev64\_opaque\_\_. When casting between any two \_\_ev64\_\*\_\_ types not including \_\_ev64\_opaque\_\_, an explicit cast is required. When casting between pointers to any two \_\_ev64\_\*\_\_ types not including \_\_ev64\_opaque\_\_, an explicit cast is required. No cast or promotion performs a conversion; the bit pattern of the result is the same as the bit pattern of the argument that is cast.

#### 2.2.4 New operators

New operators are introduced to construct \_\_ev64\_\*\_\_ values and allow full access to the functionality that the SPE architecture provides.

#### \_\_ev64\_\*\_\_ Initialization and literals

The \_\_ev64\_opaque\_\_ type is the only \_\_ev64\_\*\_\_ type that cannot be initialized. The remaining \_\_ev64\_\*\_\_ types can be initialized using the C99 array initialization syntax. Each type is treated as an array of the specified data contents of the appropriate size. The following code exemplifies the initialization of these types:

```
__ev64_u16__ a = { 0, 1, 2, 3 };
__ev64_s16__ b = { -1, -2, -3, 4 };
__ev64_u32__ c = { 3, 4 };
__ev64_s32__ d = { -2, 4 };
__ev64_u64__ e = { 17 };
__ev64_s64__ f = { 23 };
__ev64_fs__ g = { 2.4, -3.2 };

c = __ev_addw(a, (__ev64_s16__){2,1,5,2});
```

#### **New operators representing SPE operations**

New operators are introduced to allow full access to the functionality that the SPE architecture provides. Language structures that parse like function calls represent these operators in the programming language.

The names associated with these operations are all prefixed with "\_\_ev\_". The appearance of one of these forms can indicate one of the following:

- A specific SPE operation, like \_\_ev\_addw(\_\_ev64\_opaque\_\_ a, \_\_ev64\_opaque\_\_ b)
- A predicate computed from a SPE operation, like \_\_ev\_all\_eq(\_\_ev64\_opaque\_\_ a, \_\_ev64\_opaque\_\_ b)
- Creation, insertion, extraction of \_\_ev64\_opaque\_\_ values

Each operator representing an SPE operation takes a list of arguments representing the input operands (in the order in which they are shown in the architecture specification) and returns a result that could be void. The programming model restricts the operand types that are permitted for each SPE operation. Predicate intrinsics handle comparison operations in the SPE programming model.

Each compare operation has the following predicate intrinsics associated with it:

- any
- \_all\_
- \_upper\_
- \_lower\_
- select

Each predicate returns an integer (0/1) with the result of the compare. The compiler allocates a CR field for use in the comparison and to optimize conditional statements.

#### 2.2.5 Programming interface

This document does not prohibit or require an implementation to provide any set of include files to provide access to the intrinsics. If an implementation requires that an include file be used before the use of the intrinsics described in this document, that file should be <spe.h>.

This document does require that prototypes for the additional library routines described are accessible by means of the include file <spe.h>. If an implementation should provide a \_\_SPE\_\_, define it with a nonzero value. That definition should not occur in the <spe.h> header file.

PM0045 SPE operations

## 3 SPE operations

This chapter describes the following instructions:

All instructions in the e500 core complex, including numerous instructions that Book E
does not define.

 Book E instructions that are defined for 32-bit implementations, including many instructions that are not implemented on the e500 core complex.

## 3.1 Signal processing engine (SPE) APU registers

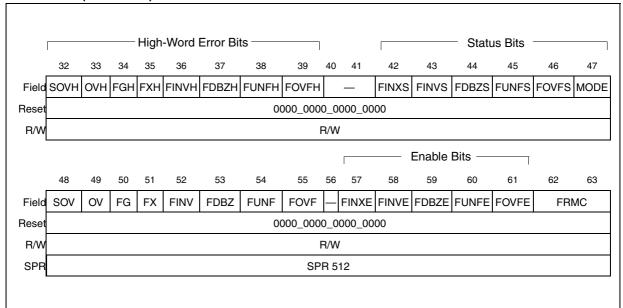

The SPE includes the following two registers:

- The signal processing and embedded floating-point status and control register (SPEFSCR), which is described in *Chapter 3.1.1.*"
- A 64-bit accumulator, which is described in *Chapter 3.1.2.*"

# 3.1.1 Signal processing and embedded floating-point status and control register (SPEFSCR)

The SPEFSCR, which is shown in *Figure 1*, is used for status and control of SPE instructions.

Figure 1. Signal processing and embedded floating-point status and control register (SPEFSCR)

SPE operations PM0045

Table 2. SPEFSCR field descriptions

Bits	Name	Function		
32	SOVH	Summary integer overflow high, which is set whenever an instruction other than <b>mtspr</b> sets OVH. SOVH remains set until a <b>mtspr[SPEFSCR]</b> clears it.		
33	OVH	teger overflow high. An overflow occurred in the upper half of the register while executing a PE integer instruction.		
34	FGH	Embedded floating-point guard bit high. Floating-point guard bit from the upper half. The value is undefined if the processor takes a floating-point exception caused by input error, floating-point overflow, or floating-point underflow.		
35	FXH	Embedded floating-point sticky bit high. Floating bit from the upper half. The value is undefined if the processor takes a floating-point exception caused by input error, floating-point overflow, or floating-point underflow.		
36	FINVH	Embedded floating-point invalid operation error high. Set when an input value on the high side is a NaN, Inf, or Denorm. Also set on a divide if both the dividend and divisor are zero.		
37	FDBZH	Embedded floating-point divide by zero error high. Set if the dividend is non-zero and the divisor is zero.		
38	FUNFH	Embedded floating-point underflow error high		
39	FOVFH	Embedded floating-point overflow error high		
40–41	_	Reserved and should be cleared		
42	FINXS	Embedded floating-point inexact sticky. FINXS = FINXS   FGH   FXH   FG   FX		
43	FINVS	Embedded floating-point invalid operation sticky. Location for software to use when implementing true IEEE floating-point.		
44	FDBZS	Embedded floating-point divide by zero sticky. FDBZS = FDBZS   FDBZH   FDBZ		
45	FUNFS	Embedded floating-point underflow sticky. Storage location for software to use when implementing true IEEE floating-point.		
46	FOVFS	Embedded floating-point overflow sticky. Storage location for software to use when implementing true IEEE floating-point.		
47	MODE	Embedded floating-point mode (read-only on e500)		
48	SOV	Integer summary overflow. Set whenever an SPE instruction other than <b>mtspr</b> sets OV. SOV remains set until <b>mtspr[SPEFSCR]</b> clears it.		
49	OV	Integer overflow. An overflow occurred in the lower half of the register while a SPE integer instruction was executed.		
50	FG	Embedded floating-point guard bit. Floating-point guard bit from the lower half. The value is undefined if the processor takes a floating-point exception caused by input error, floating-po overflow, or floating-point underflow.		
51	FX	Embedded floating-point sticky bit. Floating bit from the lower half. The value is undefined if the processor takes a floating-point exception caused by input error, floating-point overflow, of floating-point underflow.		
52	FINV	Embedded floating-point invalid operation error. Set when an input value on the high side is a NaN, Inf, or Denorm. Also set on a divide if both the dividend and divisor are zero.		
53	FDBZ	Embedded floating-point divide by zero error. Set if the dividend is non-zero and the divisor is zero.		
54	FUNF	Embedded floating-point underflow error		
		1		

PM0045 SPE operations

Table 2. SPEFSCR field descriptions (continued)

Bits	Name	Function		
55	FOVF	Embedded floating-point overflow error		
56	_	Reserved and should be cleared		
57	FINXE	Embedded floating-point inexact enable		
58	FINVE	Embedded floating-point invalid operation/input error exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if a floating-point instruction sets FINV or FINVH.		
59	FDBZE	Embedded floating-point divide-by-zero exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if a floating-point instruction sets FDBZ or FDBZH.		
60	FUNFE	Embedded floating-point underflow exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if a floating-point instruction sets FUNF or FUNFH.		
61 FOVFE 0: Exception disable 1: Exception enable If the exception is er		Embedded floating-point overflow exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if a floating-point instruction sets FOVF or FOVFH.		
Embedded floating-point rounding mode control 00: Round to nearest 62–63 FRMC 01: Round toward zero 10: Round toward +infinity 11: Round toward —infinity		00: Round to nearest 01: Round toward zero 10: Round toward +infinity		

#### 3.1.2 Accumulator (ACC)

The 64-bit architectural accumulator register shown in *Figure 2* holds the results of multiply accumulate (MAC) forms of SPE integer instructions. The ACC allows back-to-back execution of dependent MAC instructions that are in inner loops of DSP code such as FIR filters. The ACC is partially visible to the programmer; its results need not be read explicitly to be used. Instead, the results are always copied into a 64-bit destination GPR specified by the instruction. The ACC, however, must be explicitly cleared when starting a new MAC loop. Depending on the instruction type, the ACC can hold either a 64-bit value or a vector of two 32-bit elements.

The Initialize Accumulator instruction (**evmra**), which is described in the Instruction Set chapter of *Programmer's reference manual for Book E processors*, initializes the ACC.

SPE operations PM0045

Figure 2. Accumulator (ACC)

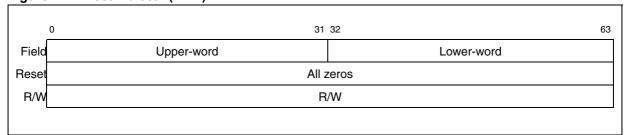

Table 3. ACC field descriptions

Bits	Name	Function	
0–31	Upper word	Holds the upper-word accumulate value for SPE multiply with accumulate instructions	
32–63	Lower word	Holds the lower-word accumulate value for SPE multiply with accumulate instructions	

## 3.2 Notation

Table 4 shows definitions and notation that appear throughout this document.

Table 4. Notation conventions

Symbol	Meaning
X <sub>p</sub>	Bit p of register/field X
X <sub>p:q</sub>	Bits p through q of register/field X
Х <sub>р q</sub>	Bits p, q, of register/field X
¬X	The ones complement of the contents of X
Field i	Bits 4×i through 4×i+3 of a register
	As the last character of an instruction mnemonic, this character indicates that the instruction records status information in certain fields of the condition register as a side effect of execution, as described in the Register Model chapter of <i>EREF: Programmer's reference manual for Book E processors</i> .
II	Describes the concatenation of two values. For example, 010 II 111 is the same as 010111.
x <sup>n</sup>	x raised to the n <sup>th</sup> power.
<sup>n</sup> x	Replication of x, n times (i.e., x concatenated to itself n–1 times). <sup>n</sup> 0 and <sup>n</sup> 1 are special cases: <sup>n</sup> 0 means a field of n bits with each bit equal to 0. Thus, <sup>5</sup> 0 is equivalent to 0b0_0000. <sup>n</sup> 1 means a field of n bits with each bit equal to 1. Thus, <sup>5</sup> 1 is equivalent to 0b1_1111.
/, //, ///,	Reserved field in an instruction or in a register. Each bit and field in instructions, in status and control registers (such as the XER), and in SPRs is defined, allocated, or reserved.

## 3.3 Instruction fields

Table 5 describes instruction fields.

PM0045 SPE operations

Table 5. Instruction field descriptions

Field	Description		
AA (30)	Absolute address bit.  0: The immediate field represents an address relative to the current instruction address.  For I-form branch instructions, the effective address of the branch target is the sum  320 II (CIA+EXTS(LIII0b00))32–63.  For B-form branch instructions, the effective address of the branch target is the sum  320 II (CIA+EXTS(BDII0b00))32–63.  For I-form branch extended instructions, the effective address of the branch target is the sum CIA+EXTS(LIII0b00).  For B-form branch extended instructions, the effective address of the branch target is the sum CIA+EXTS(BDII0b00).  1: The immediate field represents an absolute address.  For I-form branch instructions, the effective address of the branch target is the value  320 II EXTS(LIII0b00)32–63.  For B-form branch instructions, the effective address of the branch target is the value 320 II EXTS(BDII0b00)32–63.  For I-form branch extended instructions, the effective address of the branch target is the value EXTS(LIII0b00).  For B-form branch extended instructions, the effective address of the branch target is the value EXTS(LIII0b00).		
<b>crb</b> A (11–15)	Specifies a condition register bit to be used as a source		
<b>crb</b> B (16–20)	Specifies a condition register bit to be used as a source		
<b>crb</b> D (16–29)	Immediate field specifying a 14-bit signed two's complement branch displacement that is concatenated on the right with 0b00 and sign-extended to 64 bits.		
<b>crf</b> D (6-8)	Specifies a CR field to be used as a target		
<b>crf</b> S (11–13)	Specifies a CR field to be used as a source		
BI (11–15)	Specifies a condition register bit to be used as the condition of a branch conditional instruction		
BO (6–10)	Specifies options for branch conditional instructions		
crbD (6-10)	Specifies a CR bit for use as a target		
CT (6–10)	Cache touch instructions ( <b>dcbt</b> , <b>dcbtst</b> , and <b>icbt</b> ) use this field to specify the target portion of the cache facility to place the prefetched data or instructions. This field is implementation-dependent.		
D (16–31)	Immediate field that specifies a 16-bit signed two's complement integer that is sign-extended to 64 bits		
DE (16–27)	Immediate field that specifies a 12-bit signed two's complement integer that is sign-extended to 64 bits		
DES (16–27)	Immediate field that specifies a 12-bit signed two's complement integer that is concatenated on the right with 0b00 and sign-extended to 64 bits		

SPE operations PM0045

Table 5. Instruction field descriptions (continued)

Field	Description		
E (15)	Immediate field that specifies a 1-bit value that <b>wrteei</b> uses to place in MSR[EE] (external input enable bit)		
CRM (12–19)	Field mask that identifies the condition register fields that the <b>mtcrf</b> instruction updates		
LI (6–29)	Immediate field that specifies a 24-bit signed two's complement integer that is concatenated on the right with 0b00 and sign-extended to 64 bits		
LK (31)	Link bit that indicates whether the link register (LR) is set.  0: Do not set the LR.  1: Set the LR. The sum of the value 4 and the address of the branch instruction is placed into the LR.		
MB (21–25) and ME (26–30)	Fields that M-form rotate instructions use to specify a 64-bit mask consisting of 1s from bit MB+32 through bit ME+32 inclusive and 0s elsewhere		
mb (26    21–25)	Used in MD-form and MDS-form rotate instructions to specify the first 1-bit of a 64-bit mask		
me (26    21–25)	Used in MD-form and MDS-form rotate instructions to specify the last 1-bit of a 64-bit mask		
MO (6-10)	Specifies the subset of memory accesses that a Memory Barrier instruction (mbar) ordered		
NB (16–20)	Specifies the number of bytes to move in an immediate Move Assist instruction		
OPCD (0-5)	Primary opcode field		
rA (11–15)	Specifies a GPR to be used as a source or as a target		
rB (16–20)	Specifies a GPR to be used as a source		
Rc (31)	Record bit. 0: Do not alter the condition register. 1: Set condition register field 0 or field 1.		
RS (6-10)	Specifies a GPR to be used as a source		
rD (6-10)	Specifies a GPR to be used as a target		
SH (16–20)	Specifies a shift amount in Rotate Word Immediate and Shift Word Immediate instructions		
sh (30    16–20)	Specifies a shift amount in Rotate Doubleword Immediate and Shift Doubleword Immediate instructions		
SIMM (16–31)	Immediate field that specifies a 16-bit signed integer		
SPRN (16- 20ll11-15)	Specifies an SPR for <b>mtspr</b> and <b>mfspr</b> instructions		
TO (6–10)	Specifies the conditions on which to trap		
UIMM (16–31)	Immediate field that specifies a 16-bit unsigned integer		
WS (18–20)	Specifies a word in the TLB entry that is being accessed		
XO (21–29, 21– 30, 22–30, 26– 30, 27–29, 27– 30, 28–31)	Extended opcode field		

PM0045 SPE operations

## 3.4 Description of instruction operation

A series of statements that use a semi-formal language at the register transfer level (RTL) describes the operation of most instructions. RTL uses the general notation that is shown in *Table 4* and *Table 5* and conventions that are specific to RTL, shown in *Table 6*. *Figure 3 on page 29* gives an example. Some of this notation is used in the formal descriptions of instructions.

The RTL descriptions cover the normal execution of the instruction, except that the standard settings of the condition register, integer exception register, floating-point status, and control register are not always shown. (Nonstandard setting of these registers, such as the setting of the condition register field 0 by the **stwcx** instruction, is shown.) The RTL descriptions do not cover all cases in which the interrupt may be invoked, or for which the results are boundedly undefined, and may not cover all invalid forms.

RTL descriptions specify the architectural transformation that the execution of an instruction performs. They do not imply any particular implementation.

Table 6. RTL notation

Notation	Notation Meaning	
<b>←</b>	Assignment	
← <sub>f</sub>	Assignment in which the data may be reformatted in the target location	
٦	NOT logical operator (one's complement)	
+	Two's complement addition	
_	Two's complement subtraction, unary minus	
×	Multiplication	
÷	Division (yielding quotient)	
+dp	Floating-point addition, result rounded to double-precision	
-dp	Floating-point subtraction, result rounded to double-precision	
× <sub>dp</sub>	Floating-point multiplication, product rounded to double-precision	
÷dp	Floating-point division quotient, rounded to double-precision	
+ <sub>sp</sub>	Floating-point addition, result rounded to single-precision	
-sp	Floating-point subtraction, result rounded to single-precision	
×sf	Signed fractional multiplication	
× <sub>si</sub>	Signed integer multiplication	
× <sub>sp</sub>	Floating-point multiplication, result rounded to single-precision	
÷sp	Floating-point division, result rounded to single-precision	
× <sub>fp</sub>	Floating-point multiplication to infinite precision (no rounding)	
× <sub>ui</sub> Unsigned integer multiplication		
FPSquareRoot-Double(x)	Floating-point $\sqrt{x}$ , result rounded to double-precision	
FPSquareRoot-Single(x)	Floating-point $\sqrt{x}$ , result rounded to single-precision	
FPReciprocal-Estimate(x)	Floating-point estimate of $\frac{1}{x}$	

SPE operations PM0045

Table 6. RTL notation (continued)

Notation	Meaning
FPReciprocal- SquareRoot- Estimate(x)	Floating-point estimate of $\frac{1}{\sqrt{x}}$
Allocate-DataCache- Block(x)	If the block containing the byte addressed by x does not exist in the data cache, allocate a block in the data cache and set the contents of the block to 0.
Flush-DataCache- Block(x)	If the block containing the byte addressed by x exists in the data cache and is dirty, the block is written to main memory and is removed from the data cache.
Invalidate-DataCache- Block(x)	If the block containing the byte addressed by x exists in the data cache, the block is removed from the data cache.
Store-DataCache-Block(x)	If the block containing the byte addressed by x exists the data cache and is dirty, the block is written to main memory but may remain in the data cache.
Prefetch-DataCache- Block(x,y)	If the block containing the byte addressed by x does not exist in the portion of the data cache specified by y, the block in memory is copied into the data cache.
Prefetch-ForStore- DataCache-Block(x,y)	If the block containing the byte addressed by x does not exist in the portion of the data cache specified by y, the block in memory is copied into the data cache and made exclusive to the processor that is executing the instruction.
ZeroDataCache-Block(x)	The contents of the block containing the byte addressed by $\boldsymbol{x}$ in the data cache is cleared.
Invalidate-Instruction- CacheBlock(x)	If the block containing the byte addressed by x is in the instruction cache, the block is removed from the instruction cache.
Prefetch-Instruction- CacheBlock(x,y)	If the block containing the byte addressed by x does not exist in the portion of the instruction cache specified by y, the block in memory is copied into the instruction cache.
=, ≠	Equal to, Not Equal to relations
<, ≤, >, ≥	Signed comparison relations
< <sub>u</sub> , > <sub>u</sub>	Unsigned comparison relations
?	Unordered comparison relation
&,	AND, OR logical operators
⊕, ≡	Exclusive OR, Equivalence logical operators ((a≡b) = (a⊕¬b))
ABS(x)	Absolute value of x
APID(x)	Returns an implementation-dependent information on the presence and status of the auxiliary processing extensions specified by x
CEIL(x)	Least integer ≥ x
CnvtFP32Tol32Sat(fp, signed,upper_lower,round , , , , , , , , , , , , , , , , , , ,	
fractional)	

PM0045 SPE operations

Table 6. RTL notation (continued)

Notation Meaning	
Cnvtl32ToFP32Sat (v,signed,upper_lower, fractional)	Converts a 32 bit integer to a 32 bit floating point number if possible, otherwise it saturates.
EXTS(x)	Result of extending x on the left with signed bits
EXTZ(x)	Result of extending x on the left with zeros
GPR(x)	General purpose register x
MASK(x, y)	Mask that has ones in bit positions x through y (wrapping if x>y) and zeros elsewhere
MEM(x,1)	Contents of the byte of memory located at address x
MEM(x,y)(for y={2,4,8})	Contents of y bytes of memory starting at address x.  If big-endian memory, the byte at address x is the MSB and the byte at address x+y-1 is the LSB of the value being accessed.  If little-endian memory, the byte at address x is the LSB and the byte at address x+y-1 is the MSB of the value being accessed.
MOD(x,y)	Modulo y of x (remainder of x divided by y)
ROTL32(x, y)	Result of rotating the value xllx left y positions, where x is 32 bits long
SINGLE(x)	Result of converting x from floating-point double format to floating-point single format
SPREG(x)	Special-purpose register x
TRAP	Invoke a trap-type program interrupt
characterization	Reference to setting status bits in a standard way that is explained in the text
undefined	Undefined value that may vary between implementations and between different executions on the same implementation
CIA	Current instruction address, which is the address of the instruction that is described in RTL. Used by relative branches to set the next instruction address (NIA) and by branch instructions with LK=1 to set the LR. CIA does not correspond to any architected register.
NIA	Next instruction address, and the address of the next instruction to be executed. For a successful branch, the next instruction address is the branch target address: in RTL, indicated by assigning a value to NIA. For other instructions that cause non-sequential instruction fetching, the RTL is similar. For instructions that do not branch, and do not otherwise cause instruction fetching to be non-sequential, the next instruction address is CIA+4. NIA does not correspond to any architected register.
if then else	Conditional execution indenting shows range; else is optional.
do	Do loop, indenting shows range. 'To' and/or 'by' clauses specify incrementing an iteration variable, and a 'while' clause gives termination conditions.
leave	Leave innermost do loop, or do loop described in leave statement

SPE operations PM0045

*Table 7* summarizes precedence rules for RTL operators. Operators that are higher in the table are applied before those that are lower in the table. Operators at the same level in the table associate from left to right, from right to left, or not at all, as shown. (For example, the – operator associates from left to right, so a-b-c=(a-b)-c.) Using parentheses can increase clarity or override the evaluation order that the table implies; parenthesized expressions are evaluated before serving as parameters.

Table 7. Operator precedence

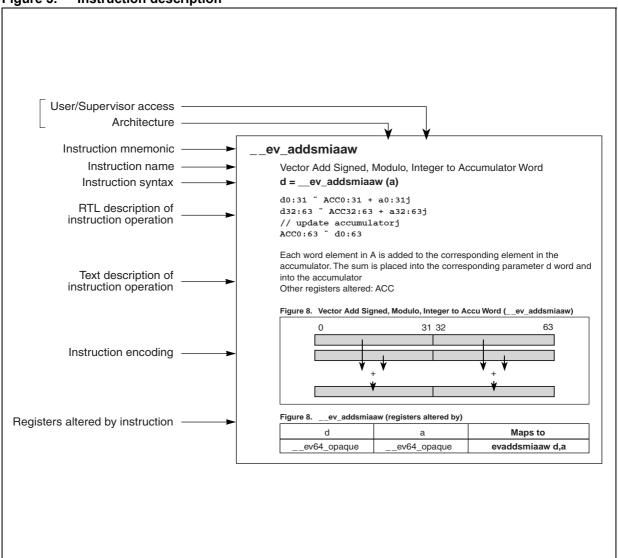

Operators	Associativity
Subscript, function evaluation	Left to right
Pre-superscript (replication), post-superscript (exponentiation)	Right to left
unary –, –	Right to left
×, ÷	Left to right
+, -	Left to right
II	Left to right
=, ≠, <, ≤, >, ≥, < <sub>U</sub> , > <sub>U</sub> , ?	Left to right
&, ⊕, ≡	Left to right
I	Left to right
: (range)	None
←	None

#### 3.5 Intrinsics

The rest of this chapter describes individual instructions, which are listed in alphabetical order by mnemonic. *Figure 3* shows the format for instruction description pages.

PM0045 SPE operations

Figure 3. Instruction description

#### 3.5.1 Intrinsic definitions

For saturation, left shifts, and bit reversal, the pseudo RTL is provided here to more accurately describe those functions that are referenced in the instruction pseudo RTL.

#### Saturation

```
SATURATE(overflow, carry, saturated_underflow, saturated_overflow,
value)
if overflow then
    if carry then
        return saturated_underflow
    else
        return saturated_overflow
else
    return value
```

SPE operations PM0045

#### Shift

```
SL(value, cnt)
if cnt > 31 then
    return 0
else
    return (value << cnt)</pre>
```

#### Bit reverse

```

PM0045 brinc

## brinc

Bit reversed increment

```
\begin{array}{lll} \textbf{d = \_brinc(a,b)} \\ n \leftarrow \texttt{MASKBITS} & // \texttt{Imp dependent \# of mask bits} \\ \texttt{mask} \leftarrow b_{64\text{-}n:63} & // \texttt{Least sig. n bits of register} \\ \texttt{temp0} \leftarrow a_{64\text{-}n:63} \\ \texttt{temp1} \leftarrow \texttt{bitreverse(1 + bitreverse(a | (\neg mask)))} \\ \texttt{d} \leftarrow a_{0:63\text{-}n} \mid \mid (\texttt{d \& mask}) \end{array}
```

**brinc** provides a way for software to access FFT data in a bit-reversed manner. Parameter a contains the index into a buffer that contains data on which FFT is to be performed. Parameter b contains a mask that allows the index to be updated with bit-reversed addressing. Typically this instruction precedes a load with index instruction; for example,

```
brinc r2, r3, r4
lhax r8, r5, r2
```

Parameter b contains a bit-mask that is based on the number of points in an FFT. To access a buffer containing n byte sized data that is to be accessed with bit-reversed addressing, the mask has  $\log_2 n$  1s in the least significant bit positions and 0s in the remaining most significant bit positions. If, however, the data size is a multiple of a half word or a word, the mask is constructed so that the 1s are shifted left by  $\log_2$  (size of the data) and 0s are placed in the least significant bit positions. *Table 8* shows example values of masks for different data sizes and number of data.

Table 8. Data samples and sizes

Number of data samples	Byte	Half word	Word	Double word
8	00000000111	00000001110	000000011100	0000000111000
16	00000001111	00000011110	000000111100	0000001111000
32	00000011111	00000111110	000001111100	0000011111000
64	00000111111	00001111110	000011111100	0000111111000

Table 9. \_\_brinc (registers altered by).

d	а	b	Maps to
uint32_t	uint32_t	uint32_t	brinc d,a,b

Architecture Note: An implementation can restrict the number of bits specified in a mask. The number of bits in a mask may not exceed 32.

Architecture Note: This instruction only modifies the lower 32 bits of the destination register in 32-bit implementations. For 64-bit implementations in 32-bit mode, the contents of the upper 32 bits of the destination register are undefined.

Architecture Note: Execution of brinc does not cause SPE Unavailable exceptions, regardless of the state of MSRSPE.

\_\_ev\_abs PM0045

# \_\_ev\_abs

Vector Absolute Value

$$d = \underline{\quad} ev_abs(a)$$

$$\begin{aligned} &\mathbf{d_{0:31}} \leftarrow \mathbf{ABS} \ (\mathbf{a_{0:31}}) \\ &\mathbf{d_{32:63}} \leftarrow \mathbf{ABS} \ (\mathbf{a_{32:63}}) \end{aligned}$$

The absolute value of each element of a parameter is placed in the corresponding elements of parameter d. An absolute value of 0x8000\_0000 (most negative number) returns 0x8000\_0000. No overflow is detected.

Figure 4. Vector absolute value (\_\_ev\_abs)

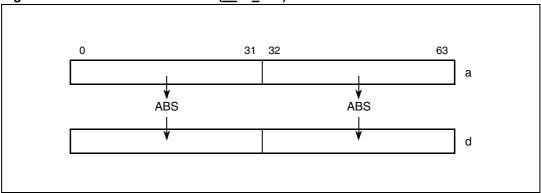

Table 10. \_\_ev\_abs (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evabs d,a

PM0045 \_\_ev\_addiw

# \_\_ev\_addiw

Vector Add Immediate Word

d= \_\_ev\_addiw (a,b)

$$\begin{array}{l} d_{0:31} \leftarrow a_{0:31} \text{ + EXTZ (b)// Modulo sum} \\ d_{32:63} \leftarrow a_{32:63} \text{ + EXTZ (b)// Modulo sum} \end{array}$$

Parameter b is zero-extended and added to both the high and low elements of parameter a and the results are placed in the parameter d.

Note: The same value is added to both elements of the register.

Figure 5. Vector add immediate word (\_\_ev\_addiw)

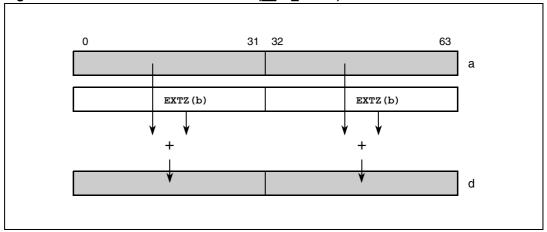

Table 11. \_\_ev\_addiw (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	5-bit unsigned literal	evaddiw d,a,b

\_\_ev\_addsmiaaw PM0045

## \_ev\_addsmiaaw

Vector Add Signed, Modulo, Integer to Accumulator Word

```
\label{eq:def_def} \begin{split} & d = \_ev\_addsmiaaw \ (a) \\ // \ & high \\ & d_{0:31} \leftarrow ACC_{0:31} \ + \ a_{0:31//} \ low \\ & d_{32:63} \leftarrow ACC_{32:63} \ + \ a_{32:63} \\ // \ & update \ accumulator \\ & ACC_{0:63} \leftarrow d_{0:63} \end{split}
```

Each word element in parameter a is added to the corresponding element in the accumulator and the results are placed in parameter d and into the accumulator.

Other registers altered: ACC

Figure 6. Vector add signed, modulo, integer to accumulator word (ev\_addsmiaaw)

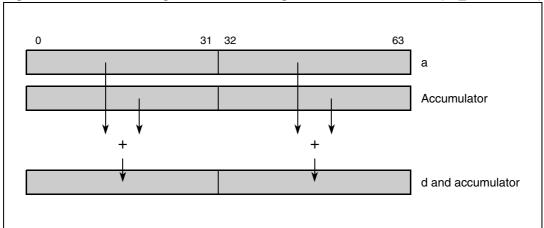

Table 12. \_\_ev\_addsmiaaw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evaddsmiaaw d,a

PM0045 ev addssiaaw

## \_ev\_addssiaaw

Vector Add Signed, Saturate, Integer to Accumulator Word

```
\label{eq:decomposition} \begin{split} d &= \_\text{ev\_addssiaaw} \, (a) \\ // \, \text{high} \\ & \text{temp}_{0:63} \leftarrow \text{EXTS} \, (\text{ACC}_{0:31}) \, + \, \text{EXTS} \, (a_{0:31}) \\ & \text{ovh} \leftarrow \text{temp}_{31} \, \oplus \, \text{temp}_{32} \\ & \text{d}_{0:31} \leftarrow \text{SATURATE} \, (\text{ovh}, \, \text{temp}_{31}, \, 0\text{x}80000000, \, 0\text{x}7fffffff, \, \text{temp}_{32:63}) \\ // \, \, \text{low} \\ & \text{temp}_{0:63} \leftarrow \text{EXTS} \, (\text{ACC}_{32:63}) \, + \, \text{EXTS} \, (a_{32:63}) \\ & \text{ovl} \leftarrow \text{temp}_{31} \, \oplus \, \text{temp}_{32} \\ & \text{d}_{32:63} \leftarrow \text{SATURATE} \, (\text{ovl}, \, \text{temp}_{31}, \, 0\text{x}80000000, \, 0\text{x}7fffffff, \, \text{temp}_{32:63}) \\ & \text{ACC}_{0:63} \leftarrow \text{d}_{0:63} \\ & \text{SPEFSCR}_{\text{OVH}} \leftarrow \text{ovh} \\ & \text{SPEFSCR}_{\text{OVH}} \leftarrow \text{ovl} \\ & \text{SPEFSCR}_{\text{SOVH}} \leftarrow \text{SPEFSCR}_{\text{SOVH}} \mid \, \text{ovh} \\ & \text{SPEFSCR}_{\text{SOV}} \leftarrow \text{SPEFSCR}_{\text{SOV}} \mid \, \text{ovl} \end{split}
```

Each signed integer word element in parameter a is sign-extended and added to the corresponding sign-extended element in the accumulator, saturating if overflow or underflow occurs, and the results are placed in parameter d and the accumulator. Any overflow or underflow is recorded in the SPEFSCR overflow and summary overflow bits.

Other registers altered: SPEFSCR ACC

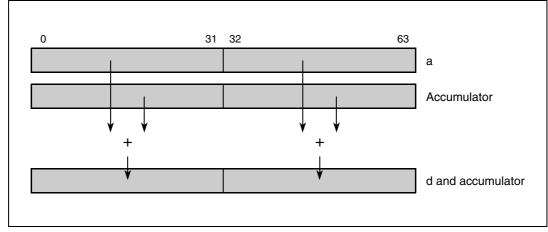

Table 13. \_\_ev\_addssiaaw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evaddssiaaw d,a

\_\_ev\_addumiaaw PM0045

# \_ev\_addumiaaw

Vector Add Unsigned, Modulo, Integer to Accumulator Word

d = \_\_ev\_addumiaaw (a)

$$\begin{array}{l} \mathbf{d_{0:31}} \!\leftarrow\! \mathtt{ACC_{0:31}} + \mathbf{a_{0:31}} \\ \mathbf{d_{32:63}} \!\leftarrow\! \mathtt{ACC_{32:63}} + \mathbf{a_{32:63}} \end{array}$$

$$\mathtt{ACC_{0:63}} \leftarrow \mathtt{d_{0:63}}$$

Each unsigned integer word element in the parameter a is added to the corresponding element in the accumulator and the results are placed in the parameter d and the accumulator.

Other registers altered: ACC

Figure 8. Vector add unsigned,modulo,integer to accumulator word (ev\_addumiaaw)

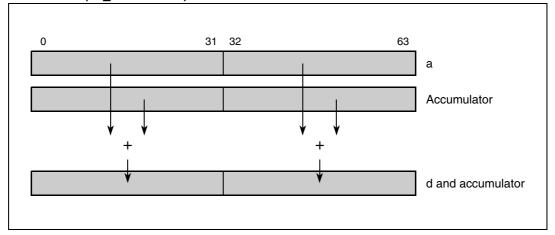

Table 14. \_\_ev\_addumiaaw (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfscmpgt x,a,b

PM0045 \_\_ev\_any\_fs\_lt

## \_\_ev\_any\_fs\_lt

Vector Any Floating-Point Less Than

$$\label{eq:def_def} \begin{split} d &= \_ev\_any\_fs\_lt(a,b) \\ &\text{if ( } (a_{0:31} < b_{0:31}) \ | \ (a_{32:63} < b_{32:63})) \ \text{then } d \leftarrow \text{true} \\ &\text{else } d \leftarrow \text{false} \end{split}$$

This intrinsic returns true if either the upper 32 bits of parameter a are less than the upper 32 bits of parameter b or the lower 32 bits of parameter a are less than the lower 32 bits of parameter b.

Figure 27. Vector any floating-point less than (\_\_ev\_any\_fs\_lt)

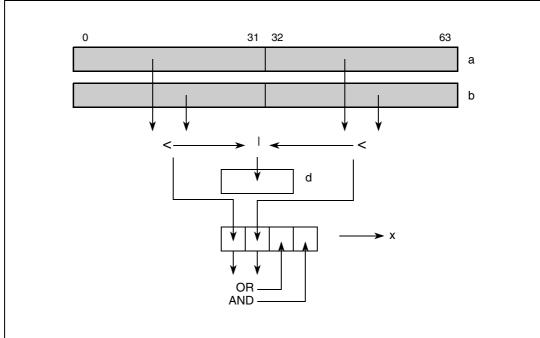

Table 33. \_\_ev\_any\_fs\_lt (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfscmplt x,a,b

\_\_ev\_any\_fs\_tst\_eq PM0045

### \_\_ev\_any\_fs\_tst\_eq

Vector Any Floating-Point Test Equal

$$\label{eq:def_def} \begin{split} d &= \_ev\_any\_fs\_tst\_eq(a,b) \\ &\text{if (} (a_{0:31} = b_{0:31}) \ | \ (a_{32:63} = b_{32:63})) \ \text{then } d \leftarrow \text{true} \\ &\text{else } d \leftarrow \text{false} \end{split}$$

This intrinsic returns true if either the upper 32 bits of parameter a are equal to the upper 32 bits of parameter b or the lower 32 bits of parameter a are equal to the lower 32 bits of parameter b. This intrinsic differs from \_\_ev\_any\_fs\_eq because no exceptions are taken during its execution. If strict IEEE 754 compliance is required, use \_\_ev\_any\_fs\_eq instead.

Figure 28. Vector any floating-point test equal (\_\_ev\_any\_fs\_tst\_eq)

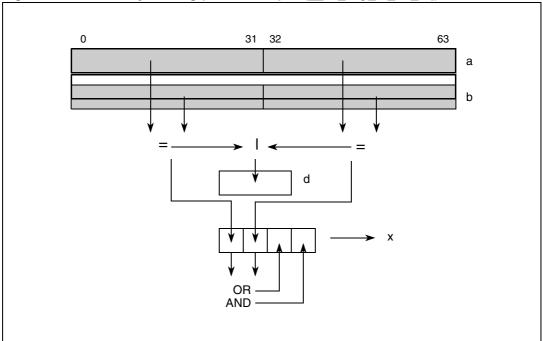

Table 34. \_\_ev\_any\_fs\_tst\_eq (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfststeq x,a,b

PM0045 \_\_ev\_any\_fs\_tst\_gt

## \_\_ev\_any\_fs\_tst\_gt

Vector Any Floating-Point Test Greater Than

$$\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_any\_fs\_tst\_gt(a,b)} \\ &\text{if (} (\textbf{a}_{0:31} > \textbf{b}_{0:31}) \text{ | } (\textbf{a}_{32:63} > \textbf{b}_{2:63})) \text{ then } \textbf{d} \leftarrow \texttt{true} \\ &\text{else } \textbf{d} \leftarrow \texttt{false} \end{split}$$

This intrinsic returns true if either the upper 32 bits of parameter a are greater than the upper 32 bits of parameter b or the lower 32 bits of parameter a are greater than the lower 32 bits of parameter b. This intrinsic differs from \_\_ev\_any\_fs\_gt because no exceptions are taken during its execution. If strict IEEE 754 compliance is required, use \_\_ev\_any\_fs\_gt instead.

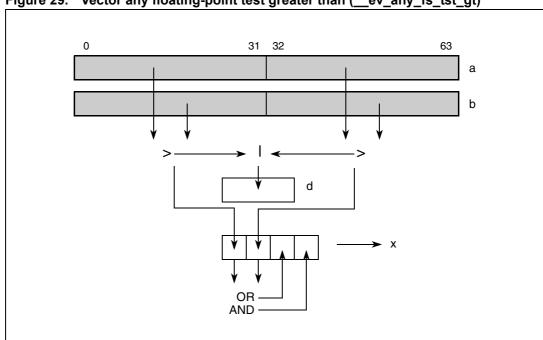

Figure 29. Vector any floating-point test greater than (\_\_ev\_any\_fs\_tst\_gt)

Table 35. \_\_ev\_any\_fs\_tst\_gt (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfststgt x,a,b

\_\_ev\_any\_fs\_tst\_lt PM0045

### \_\_ev\_any\_fs\_tst\_lt

Vector Any Floating-Point Test Less Than

$$\label{eq:def_def} \begin{split} d = & \_ev\_any\_fs\_tst\_lt(a,b) \\ \text{if ( } (a_{0:31} < b_{0:31}) \ | \ | \ (a_{32:63} < b_{32:63})) \ \text{then } d \leftarrow \text{true} \\ \text{else } d \leftarrow & \text{false} \end{split}$$

This intrinsic returns true if either the upper 32 bits of parameter a are less than the upper 32 bits of parameter b or the lower 32 bits of parameter a are less than the lower 32 bits of parameter b. This intrinsic differs from \_\_ev\_any\_fs\_It because no exceptions are taken during its execution. If strict IEEE 754 compliance is required, use \_\_ev\_any\_fs\_It instead.

Figure 30. Vector any floating-point test less than (\_\_ev\_any\_fs\_tst\_lt)

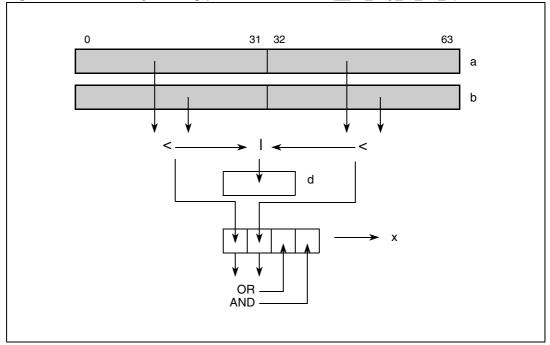

Table 36. \_\_ev\_any\_fs\_tst\_lt (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfststlt x,a,b

PM0045 \_\_ev\_any\_gts

#### \_\_ev\_any\_gts

Vector AND with Complement

$$d = \underline{\quad} ev_any_gts(a,b)$$

if ((a<sub>0:31</sub> ><sub>signed</sub> b<sub>0:31</sub>)|(a<sub>32:63</sub> ><sub>signed</sub> b<sub>32:63</sub>)) then d 
$$\leftarrow$$
 true else d  $\leftarrow$  false

This intrinsic returns true if either the upper 32 bits of parameter a are greater than the upper 32 bits of parameter b or the lower 32 bits of parameter a are greater than the lower 32 bits of parameter b.

Figure 31. Vector any greater than signed (\_\_ev\_any\_gts)

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmpgtu x,a,b

PM0045 \_\_ev\_any\_lts

## \_\_ev\_any\_lts

Vector Any Element Less Than Signed

$$d = \underline{\quad} ev_any_lts(a,b)$$

if ( 
$$(a_{0:31} <_{signed} b_{0:31})$$
 |  $(a_{32:63} <_{signed} b_{32:63}))$  then  $d \leftarrow$  true else  $d \leftarrow false$ 

This intrinsic returns true if either the upper 32 bits of parameter a are less than the upper 32 bits of parameter b or the lower 32 bits of parameter a are less than the lower 32 bits of parameter b.

Figure 33. Vector any less than signed(\_\_ev\_any\_lts)

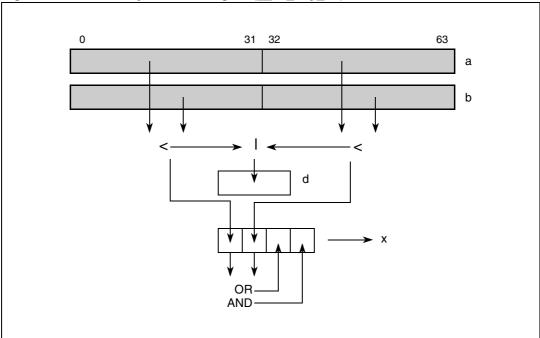

Table 39. \_\_ev\_any\_lts (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmplts x,a,b

\_\_ev\_any\_ltu PM0045

## \_\_ev\_any\_ltu

Vector Any Element Less Than Unsigned

$$d = \underline{\quad} ev_any_Itu(a,b)$$

if ( 
$$(a_{0:31} <_{unsigned} b_{0:31})$$
 |  $(a_{32:63} <_{unsigned} b_{32:63}))$  then  $d \leftarrow true$  else  $d \leftarrow false$ 

This intrinsic returns true if either the upper 32 bits of parameter a are less than the upper 32 bits of parameter b or the lower 32 bits of parameter a are less than the lower 32 bits of parameter b.

Figure 34. Vector any less than unsigned (\_\_ev\_any\_ltu)

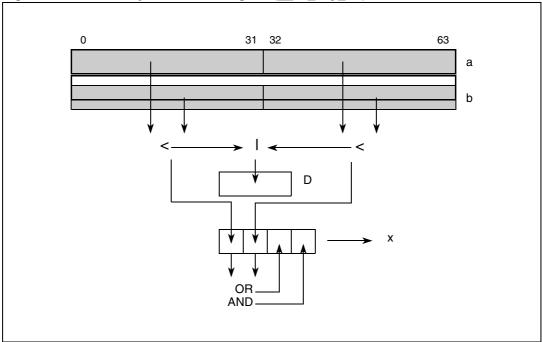

Table 40. \_\_ev\_any\_ltu (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmpltu x,a,b

PM0045 \_\_ev\_cntlsw

## \_\_ev\_cntlsw

Vector Count Leading Signed Bits Word

#### $d = \underline{\quad} ev\_cntlsw(a)$

The leading signed bits in each element of parameter a are counted, and the count is placed into each element of parameter d.

**evcntlzw** is used for unsigned parameters; **evcntlsw** is used for signed parameters.

Figure 35. Vector count leading signed bits word (\_\_ev\_cntlsw)

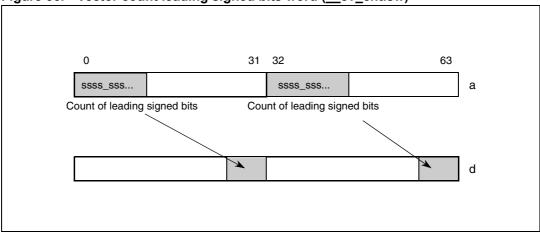

Table 41. \_\_ev\_cntlsw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evcntlsw d,a

\_\_ev\_cntlzw PM0045

# \_\_ev\_cntlzw

Vector Count Leading Zeros Word

#### $d = \underline{\quad} ev\_cntlzw(a)$

The leading zero bits in each element of parameter a are counted, and the respective count is placed into each element of parameter d.

Figure 36. Vector Count Leading Signed Bits Word (\_\_ev\_cntlzw)

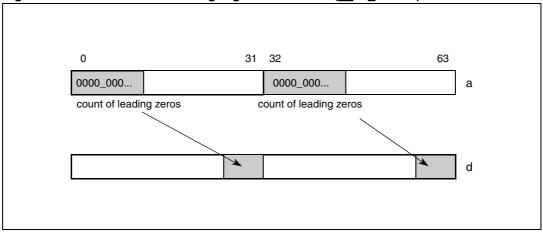

Table 42. \_\_ev\_cntlzw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evcntlzw d,a

PM0045 ev divws

#### ev divws

Vector Divide Word Signed

```
d = \underline{\quad} ev\_divws (a,b)
    \texttt{dividendh} \leftarrow a_{\texttt{0:31}}
    \texttt{dividendl} \leftarrow a_{\texttt{32:63}}
    divisorh \leftarrow b_{0:31}
    \texttt{divisorl} \leftarrow \texttt{b}_{\texttt{32:63}}
    d_{0:31} \leftarrow dividendh \div divisorh
    d_{32:63} \leftarrow dividendl \div divisorl
    ovh \leftarrow 0
    ovl \leftarrow 0
    if ((dividendh < 0) & (divisorh = 0)) then
         \mathtt{d_{0:31}} \!\leftarrow \mathtt{0x800000000}
         ovh \leftarrow 1
    else if ((dividendh >= 0) & (divisorh = 0)) then
         \mathbf{d_{0:31}} \leftarrow \mathtt{0x7FFFFFF}
         ovh \leftarrow \mathbf{1}
    else if ((dividendh = 0x80000000) & (divisorh = 0xFFFF_FFFF))
then
         d_{0:31} \leftarrow 0x7FFFFFFF
         ovh \leftarrow \mathbf{1}
    if ((dividend1 < 0) & (divisor1 = 0)) then
         \mathtt{d_{32:63}}\!\leftarrow \mathtt{0x80000000}
         ovl \leftarrow 1
    else if ((dividendl >= 0) & (divisorl = 0)) then
         \texttt{d}_{\texttt{32:63}} \leftarrow \texttt{0x7FFFFFF}
         ovl \leftarrow 1
    else if ((dividendl = 0x80000000) & (divisorl = 0xFFFF_FFFF))
then
         \texttt{d}_{\texttt{32:63}} \leftarrow \texttt{0x7FFFFFF}
         ovl \leftarrow 1
    \mathtt{SPEFSCR}_{\mathtt{OVH}} \leftarrow \mathtt{ovh}
    \mathtt{SPEFSCR}_{OV} \leftarrow \mathtt{ovl}
    \mathtt{SPEFSCR}_{\mathtt{SOVH}} \leftarrow \mathtt{SPEFSCR}_{\mathtt{SOVH}} \mid \mathtt{ovh}
    SPEFSCR_{SOV} \leftarrow SPEFSCR_{SOV} \mid ovl
```

The two dividends are the two elements of the contents of parameter a. The two divisors are the two elements of the contents of parameter b. The resulting two 32-bit quotients on each element are placed into parameter d. The remainders are not supplied. Parameters and quotients are interpreted as signed integers. If overflow, underflow, or divide by zero occurs, the overflow and summary overflow SPEFSCR bits are set. Note that any overflow indication is always set as a side effect of this instruction. No form is defined that disables the setting of the overflow bits. In case of overflow, a saturated value is delivered into the destination register.

Figure 37. Vector divide word signed (\_\_ev\_divws)

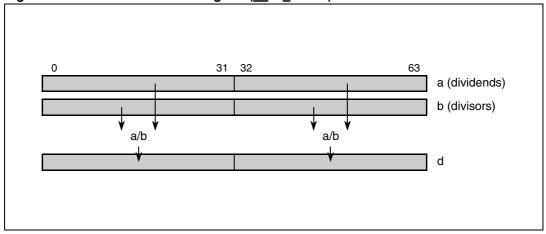

Table 43. \_\_ev\_divws (registered altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evdivws d,a,b

PM0045 \_\_ev\_divwu

#### \_\_ev\_divwu

Vector Divide Word Unsigned

```
d = \underline{\quad} ev_{divwu}(a,b)
      \mathtt{dividendh} \leftarrow \mathbf{a_{0:31}}
      \texttt{dividendl} \; \leftarrow \; a_{\texttt{32:63}}
      divisorh \leftarrow b_{0:31}
      \texttt{divisorl} \, \leftarrow \, \texttt{b}_{\texttt{32:63}}
      d_{0:31} \leftarrow dividendh \div divisorh
      \texttt{d}_{\texttt{32:63}} \leftarrow \texttt{dividendl} \, \div \, \texttt{divisorl}
      ovh \; \leftarrow \; 0
      \texttt{ovl} \; \leftarrow \; \texttt{0}
      if (divisorh = 0) then
            d_{0:31} = 0xFFFFFFF
            ovh \leftarrow 1
      if (divisorl = 0) then
              d_{32:63} \leftarrow 0xFFFFFFFF
              \texttt{ovl} \, \leftarrow \, \texttt{1}
      \mathtt{SPEFSCR}_{\mathtt{OVH}} \, \leftarrow \, \mathtt{ovh}
      \mathtt{SPEFSCR}_{\mathtt{OV}} \, \leftarrow \, \mathtt{ovl}
      \mathtt{SPEFSCR}_{\mathtt{SOVH}} \leftarrow \mathtt{SPEFSCR}_{\mathtt{SOVH}} \mid \mathtt{ovh}
      \mathtt{SPEFSCR}_{\mathtt{SOV}} \leftarrow \mathtt{SPEFSCR}_{\mathtt{SOV}} \mid \mathtt{ovl}
```

The two dividends are the two elements of the contents of parameter a. The two divisors are the two elements of the contents of parameter b. Two 32-bit quotients are formed as a result of the division on each of the high and low elements and the quotients are placed into parameter d. Remainders are not supplied. Parameters and quotients are interpreted as unsigned integers. If a divide by zero occurs, the overflow and summary overflow SPEFSCR bits are set. Note that any overflow indication is always set as a side effect of this instruction. No form is defined that disables the setting of the overflow bits. In case of overflow, a saturated value is delivered into the destination register.

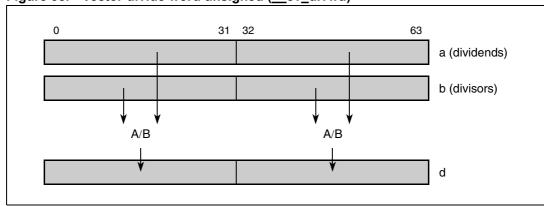

Table 44. \_\_ev\_divwu (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evdivwu d,a,b

\_\_ev\_eqv PM0045

#### \_\_ev\_eqv

Vector Equivalent

$$d = \underline{\quad} ev_eqv (a,b)$$

$$\begin{array}{l} d_{\text{0:31}} \leftarrow a_{\text{0:31}} \equiv b_{\text{0:31}} \text{ // Bitwise XNOR} \\ d_{\text{32:63}} \leftarrow a_{\text{32:63}} \equiv b_{\text{32:63}} \text{ // Bitwise XNOR} \end{array}$$

The corresponding elements of parameters a and b are XNORed bitwise, and the results are placed in the parameter d.

Figure 39. Vector equivalent (\_\_ev\_eqv)

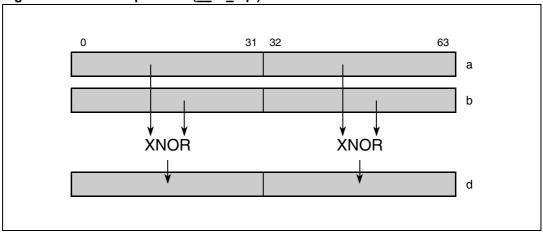

Table 45. \_\_ev\_eqv (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	eveqv d,a,b

PM0045 \_\_ev\_extsb

### \_\_ev\_extsb

Vector Extend Sign Byte

$$\begin{array}{l} {\tt d_{0:31}} \leftarrow {\tt EXTS\,(a_{24:31})} \\ {\tt d_{32:63}} \leftarrow {\tt EXTS\,(a_{56:63})} \end{array}$$

The signs of the byte in each of the elements in parameter a are extended, and the results are placed in the parameter d.

Figure 40. Vector extend sign byte (\_\_ev\_extsb)

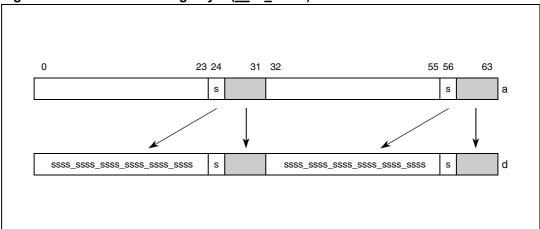

Table 46. \_\_ev\_extsb (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evextsb d,a

\_\_ev\_extsh PM0045

### \_ev\_extsh

Vector Extend Sign Half Word

$$\begin{array}{l} {\tt d_{0:31}} \leftarrow {\tt EXTS\,(a_{16:31})} \\ {\tt d_{32:63}} \leftarrow {\tt EXTS\,(a_{48:63})} \end{array}$$

The signs of the half words in each of the elements in parameter a are extended, and the results are placed into parameter d.

Figure 41. Vector extend sign half word (\_\_ev\_extsh)

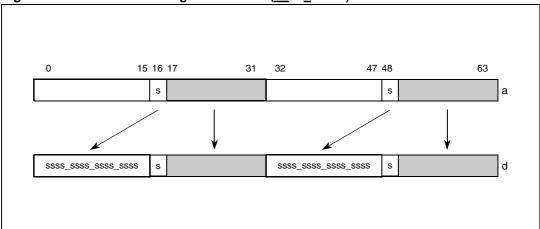

Table 47. \_\_ev\_extsh (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evextsh d,a

PM0045 \_\_ev\_fsabs

# \_\_ev\_fsabs

Vector Floating-Point Absolute Value

$$\begin{array}{l} d_{0:31} \leftarrow \text{ 0b0 } \mid \mid \ a_{1:31} \\ d_{32:63} \leftarrow \text{ 0b0 } \mid \mid \ a_{33:63} \end{array}$$

The signed bits of each element of parameter a are cleared, and the result is placed into parameter d. No exceptions are taken during the execution of this instruction.

Figure 42. Vector floating-point absolute value (\_\_ev\_fsabs)

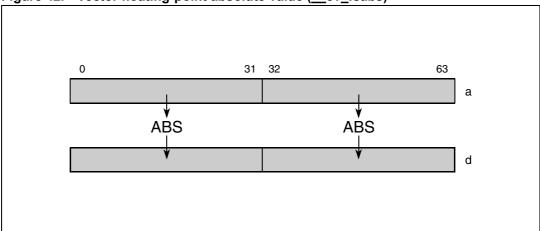

Table 48. \_\_ev\_fsabs (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtsabs d,a

\_\_ev\_fsadd PM0045

#### \_\_ev\_fsadd

Vector Floating-Point Add

$$d = \underline{\quad} ev_fsadd(a,b)$$

$$\begin{array}{l} \textbf{d_{0:31}} \leftarrow \textbf{a_{0:31}} +_{sp} \textbf{b_{0:31}} \\ \textbf{d_{32:63}} \leftarrow \textbf{a_{32:63}} +_{sp} \textbf{b_{32:63}} \end{array}$$

The single-precision floating-point value of each element of parameter a is added to the corresponding element in parameter b, and the results are placed in parameter d.

If an overflow condition is detected or the contents of parameters a or b are NaN or Infinity, the result is an appropriately signed maximum floating-point value.

If an underflow condition is detected, the result is an appropriately signed floating-point 0.

The following status bits are set in the SPEFSCR:

- FINV, FINVH if the contents of rA or rB are +inf, -inf, Denorm, or NaN
- FOFV, FOFVH if an overflow occurs
- FUNF, FUNFH if an underflow occurs
- FINXS, FG, FGH, FX, FXH if the result is inexact or overflow occurred and overflow exceptions are disabled

Figure 43. Vector floating-point add (\_\_ev\_fsadd)

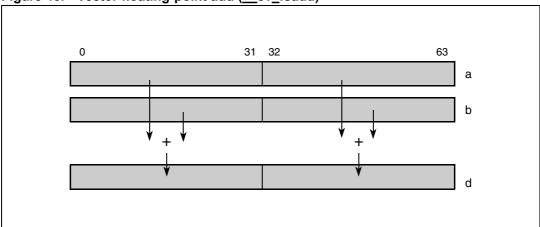

Table 49. \_\_ev\_fsadd (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evfsadd d,a,b

PM0045 \_\_ev\_fscfsf

### \_\_ev\_fscfsf

Vector Convert Floating-Point from Signed Fraction

```
d = __ev_fscfsf (a)
```

```
\begin{aligned} &d_{0:31} \leftarrow \texttt{CnvtI32ToFP32Sat}(a_{0:31}, \ \texttt{SIGN}, \ \texttt{UPPER}, \ \texttt{F}) \\ &d_{32:63} \leftarrow \texttt{CnvtI32ToFP32Sat}(a_{32:63}, \ \texttt{SIGN}, \ \texttt{LOWER}, \ \texttt{F}) \end{aligned}
```

The signed fractional values in each element of parameter a are converted to the nearest single-precision floating-point value using the current rounding mode and placed in parameter d.

The following status bits are set in the SPEFSCR:

FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 44. Vector convert floating-point from signed fraction (\_\_ev\_fscfsf)

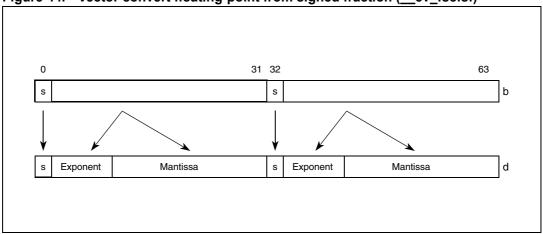

Table 50. \_\_ev\_fscfsf (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtscfsf d,a

\_\_ev\_fscfsi PM0045

## \_\_ev\_fscfsi

Vector Convert Floating-Point from Signed Integer d = \_\_ev\_fscfsi (a)

```
\begin{aligned} &d_{0:31} \leftarrow \texttt{CnvtSI32ToFP32Sat}(a_{0:31}, \ \texttt{SIGN}, \ \texttt{UPPER}, \ \texttt{I}) \\ &d_{32:63} \leftarrow \texttt{CnvtSI32ToFP32Sat}(a_{32:63}, \ \texttt{SIGN}, \ \texttt{LOWER}, \ \texttt{I}) \end{aligned}
```

The signed integer values in each element in parameter a are converted to the nearest single-precision floating-point value using the current rounding mode and placed in parameter d.

The following status bits are set in the SPEFSCR:

FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 45. Vector convert floating-point from signed integer (\_\_ev\_fscfsi)

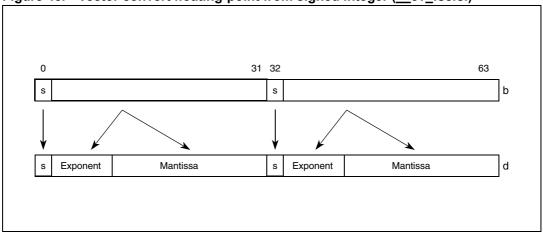

Table 51. \_\_ev\_fscfsi (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtscfsi d,a

PM0045 \_\_ev\_fscfuf

### \_\_ev\_fscfuf

Vector Convert Floating-Point from Unsigned Fraction

```
d = __ev_fscfuf (a)
```

```
\begin{aligned} &d_{0:31} \leftarrow \texttt{CnvtI32ToFP32Sat}(a_{0:31}, \ \texttt{UNSIGN}, \ \texttt{UPPER}, \ \texttt{F}) \\ &d_{32:63} \leftarrow \texttt{CnvtI32ToFP32Sat}(a_{32:63}, \ \texttt{UNSIGN}, \ \texttt{LOWER}, \ \texttt{F}) \end{aligned}
```

The unsigned fractional values in each element of parameter a are converted to the nearest single-precision floating-point value using the current rounding mode and placed in parameter d.

The following status bits are set in the SPEFSCR:

FINXS, FG, FX if the result is inexact

Figure 46. Vector convert floating-point from unsigned fraction (\_\_ev\_fscfuf)

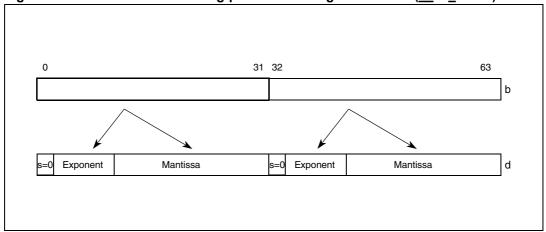

Table 52. \_\_ev\_fscfuf (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtscfuf d,a

\_\_ev\_fscfui PM0045

## \_\_ev\_fscfui

Vector Convert Floating-Point from Unsigned Integer

```
d = __ev_fscfui (a)
```

```
\begin{aligned} &d_{0:31} \leftarrow \texttt{CnvtI32ToFP32Sat}(a_{031}, \ \texttt{UNSIGN}, \ \texttt{UPPER}, \ \texttt{I}) \\ &d_{32:63} \leftarrow \texttt{CnvtI32ToFP32Sat}(a_{32:63}, \ \texttt{UNSIGN}, \ \texttt{LOWER}, \ \texttt{I}) \end{aligned}
```

The unsigned integer value in each element of parameter a are converted to the nearest single-precision floating-point value using the current rounding mode and placed in parameter d.

The following status bits are set in the SPEFSCR:

• FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 47. Vector convert floating-point from unsigned integer (\_\_ev\_fscfui)

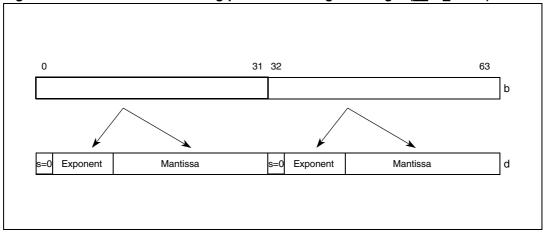

Table 53. \_\_ev\_fscfui (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtscfui d,a

PM0045 ev fsctsf

### \_\_ev\_fsctsf

Vector Convert Floating-Point to Signed Fraction

```
d = \underline{\quad} ev_f sctsf(a)
```

```
\begin{aligned} & d_{0:31} \leftarrow \texttt{CnvtFP32ToISat}(a_{0:31}, \texttt{SIGN}, \texttt{UPPER}, \texttt{ROUND}, \texttt{F}) \\ & d_{32:63} \leftarrow \texttt{CnvtFP32ToISat}(a_{32:63}, \texttt{SIGN}, \texttt{LOWER}, \texttt{ROUND}, \texttt{F}) \end{aligned}
```

The single-precision floating-point value in each element of parameter a is converted to a signed fraction using the current rounding mode and the results are placed in parameter d. The result saturates if it cannot be represented in a 32-bit fraction. NaNs are converted to 0.

- FINV, FINVH if the contents of parameter a are +inf, -inf, Denorm, or NaN or parameter a cannot be represented in the target format
- FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 48. Vector convert floating-point to signed fraction (\_\_ev\_x)

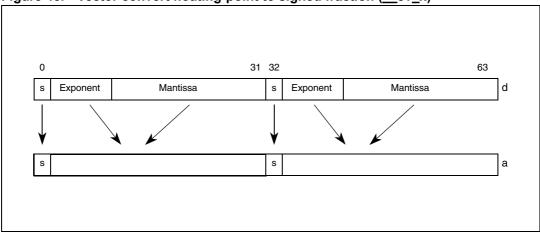

Table 54. \_\_ev\_fsctsf (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtsctsf d,a

\_ev\_fsctsi PM0045

### \_\_ev\_fsctsi

Vector Convert Floating-Point to Signed Integer

```
d = __ev_fsctsi (a)
```

```
\begin{aligned} & d_{0:31} \leftarrow \texttt{CnvtFP32ToISat}(a_{0:31}, \, \texttt{SIGN}, \, \texttt{UPPER}, \, \texttt{ROUND}, \, \texttt{I}) \\ & d_{32:63} \leftarrow \texttt{CnvtFP32ToISat}(a_{32:63}, \, \texttt{SIGN}, \, \texttt{LOWER}, \, \texttt{ROUND}, \, \texttt{I}) \end{aligned}
```

The single-precision floating-point value in each element of parameter a is converted to a signed integer using the current rounding mode, and the results are placed in parameter d. The result saturates if it cannot be represented in a 32-bit integer. NaNs are converted to 0.

- FINV, FINVH if the contents of parameter a are +inf, -inf, Denorm or NaN or parameter a cannot be represented in the target format
- FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 49. Vector convert floating-point to signed integer (\_\_ev\_fsctsi)

d	а	Maps to	
ev64_opaque	ev64_opaque	evtsctuf d,a	

PM0045 \_\_ev\_fsctui

### \_\_ev\_fsctui

Vector Convert Floating-Point to Unsigned Integer

```
d = __ev_fsctui (a)
```

```
\begin{aligned} & d_{0:31} \leftarrow \texttt{CnvtFP32ToISat}(a_{0:31}, \texttt{UNSIGN}, \texttt{UPPER}, \texttt{ROUND}, \texttt{I}) \\ & d_{32:63} \leftarrow \texttt{CnvtFP32ToISat}(a_{32:63}, \texttt{UNSIGN}, \texttt{LOWER}, \texttt{ROUND}, \texttt{I}) \end{aligned}
```

The single-precision floating-point value in each element of parameter a is converted to an unsigned integer using the current rounding mode, and the results are placed in parameter d. The result saturates if it cannot be represented in a 32-bit unsigned integer. NaNs are converted to 0.

- FINV, FINVH if the contents of parameter a are +inf, -inf, Denorm or NaN or parameter a cannot be represented in the target format
- FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 52. Vector convert floating-point to unsigned integer (\_\_ev\_fsctui)

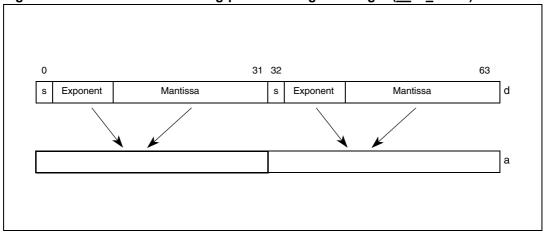

Table 58. \_\_ev\_fsctui (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtsctui d,a

\_\_ev\_fsctuiz PM0045

### \_ev\_fsctuiz

Vector Convert Floating-Point to Unsigned Integer with Round toward Zero

```
d = __ev_fsctuiz (a)
```

```
\begin{aligned} &d_{0:31} \leftarrow \texttt{CnvtFP32ToISat}(a_{0:31}, \texttt{UNSIGN}, \texttt{UPPER}, \texttt{TRUNC}, \texttt{I}) \\ &d_{32:63} \leftarrow \texttt{CnvtFP32ToISat}(a_{32:63}, \texttt{UNSIGN}, \texttt{LOWER}, \texttt{TRUNC}, \texttt{I}) \end{aligned}
```

The single-precision floating-point value in each element of parameter a is converted to an unsigned integer using the rounding mode Round towards Zero, and the results are placed in parameter d. The result saturates if it cannot be represented in a 32-bit unsigned integer. NaNs are converted to 0.

- FINV, FINVH if the contents of parameter a are +inf, -inf, Denorm, or NaN or parameter a cannot be represented in the target format
- FINXS, FG, FGH, FX, FXH if the result is inexact

Figure 53. Vector convert floating-point to unsigned integer with roundtoward zero (\_\_ev\_fsctuiz)

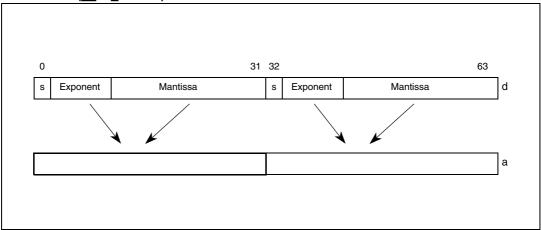

Table 59. \_\_ev\_fsctuiz (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtsctuiz d,a

PM0045 ev fsdiv

#### \_\_ev\_fsdiv

Vector Floating-Point Divide

$$d = \underline{ev_fsdiv(a,b)}$$

$$\begin{array}{l} \mathbf{d_{0:31}} \leftarrow \mathbf{a_{0:31}} \div_{sp} \mathbf{b_{0:31}} \\ \mathbf{d_{32:63}} \leftarrow \mathbf{a_{32:63}} \div_{sp} \mathbf{d_{32:63}} \end{array}$$

The single-precision floating-point value in each element of parameter a is divided by the corresponding elements in parameter b, and the results are placed in parameter d.

If an overflow is detected, parameter b is a Denorm (or 0 value), or parameter a is a NaN or Infinity and parameter b is a normalized number, the result is an appropriately signed maximum floating-point value.

If an underflow is detected or parameter b is a NaN or Infinity, the result is an appropriately signed floating-point 0.

- FINV, FINVH if the contents of parameter a or b are +inf, -inf, Denorm, or NaN
- FOFV, FOFVH if an overflow occurs
- FUNV, FUNVH if an underflow occurs
- FDBZS, FDBZ, FDBZH if a divide by zero occurs
- FINXS, FG, FGH, FX, FXH if the result is inexact or overflow occurred and overflow exceptions are disabled

Figure 54. Vector floating-point divide (\_\_ev\_fsdiv)

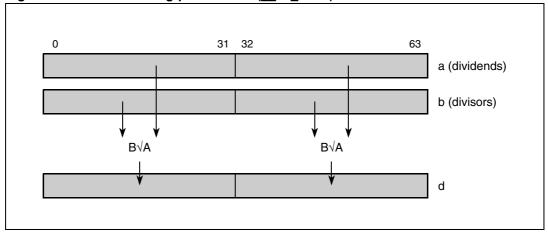

Table 60. \_\_ev\_fsdiv (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evfsdiv d,a,b

ev fsmul PM0045

#### \_ev\_fsmul

**Vector Floating-Point Multiply** 

```
\begin{aligned} & \mathbf{d} = \mathbf{\underline{-ev_fsmul}} \ (\mathbf{a,b}) \\ & \mathbf{d_{0:31}} \leftarrow \mathbf{a_{0:31}} \times_{\mathbf{sp}} \mathbf{b_{0:31}} \\ & \mathbf{d_{32:63}} \leftarrow \mathbf{a_{32:63}} \times_{\mathbf{sp}} \mathbf{b_{32:63}} \end{aligned}
```

Each single-precision floating-point element of parameter a is multiplied with the corresponding element of parameter b, and the result is stored in parameter d. If an overflow is likely, pmax or nmax is stored in parameter d. If an underflow is likely, +0, or -0 is stored in parameter d. The following condition defines when an overflow is likely and the corresponding result for each element of the vector:

```
ei = (ea - 127) + (eb - 127) + 127 if (sa = sb) then if (ei \geq 127) then r = pmax else if (ei < -126) then r = +0 else if (ei \geq 127) then r = nmax else if (ei < -126) then r = -0
```

- If the contents of parameter a or b are +inf, -inf, Denorm, QNaN, or SNaN, at least one of the SPEFSCR[FINVH] or SPEFSCR[FINV] bits is set.
- If an overflow occurs or is likely, at least one of the SPEFSCR[FOVFH] or SPEFSCR[FOVF] bits is set.
- If an underflow occurs or is likely, at least one of the SPEFSCR[FUNFH] or SPEFSCR[FUNF] bits is set.
- If the exception is enabled for the high or low element in which the error occurs, the exception is taken.

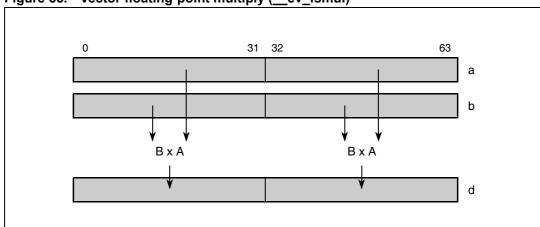

Figure 55. Vector floating-point multiply (\_\_ev\_fsmul)

Table 61. \_\_ev\_fsmul (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evfsmul d,a,b

PM0045 \_\_ev\_fsnabs

# \_\_ev\_fsnabs

Vector Floating-Point Negative Absolute Value

$$d = \underline{ev_fsnabs}$$
 (a)

$$\begin{array}{l} d_{0:31} \leftarrow \text{ 0b1 } \mid \mid \ a_{1:31} \\ d_{32:63} \leftarrow \text{ 0b1 } \mid \mid \ a_{33:63} \end{array}$$

The signed bits of each element of parameter a are all set and the result is placed into parameter d. No exceptions are taken during the execution of this instruction.

Figure 56. Vector floating-point negative absolute value (\_\_ev\_fsnabs)

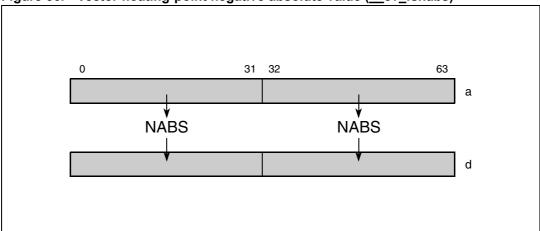

Table 62. \_\_ev\_fsnabs (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evtsnabs d,a

\_\_ev\_fsneg PM0045

# \_\_ev\_fsneg

Vector Floating-Point Negate

$$d = \underline{ev_fsneg}(a)$$

$$\begin{array}{l} d_{0:31} \leftarrow \neg a_0 \ | \ | \ a_{1:31} \\ d_{32:63} \leftarrow \neg a_{32} \ | \ | \ a_{33:63} \end{array}$$

The signed bits of each element of parameter a are complemented and the result is placed into parameter d. No exceptions are taken during the execution of this instruction.

Figure 57. Vector floating-point negate (\_\_ev\_fsneg)

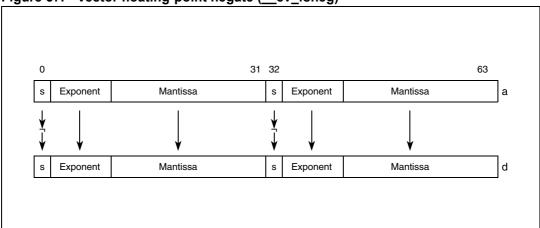

Table 63. \_\_ev\_fsneg (registers altered by).

d a		Maps to
ev64_opaque	ev64_opaque	evtsneg d,a

PM0045 ev fssub

#### \_\_ev\_fssub

**Vector Floating-Point Subtract** 

```
d = \underline{ev_fssub}(a,b)
```

$$\begin{array}{l} \textbf{d_{0:31}} \leftarrow \textbf{a_{0:31}} -_{sp} \textbf{b_{0:31}} \\ \textbf{d_{32:63}} \leftarrow \textbf{a_{32:63}} -_{sp} \textbf{b_{32:63}} \end{array}$$

Each single-precision floating-point element of parameter b is subtracted from the corresponding element of parameter a and the result is stored in parameter d. If an overflow is likely, pmax or nmax is stored in parameter d. If an underflow is likely, +0 or -0 is stored in parameter d. The following condition defines how boundary cases of inputs (+inf, -inf, Denorm, QNaN, SNaN) are treated, when an overflow is likely, and the corresponding result for each element of the vector:

```
if ((sa = 0) & (sb = 1)) then

if (max(ea, eb) \geq 127) then r = pmax

else if ((sa = 1) & (sb = 0)) then

if (max(ea, eb) \geq 127) then r = nmax

else if (sa = sb) then

// Boundary case to be defined later
```

- If the contents of parameter a or b are +inf, -inf, Denorm, QNaN, or SNaN, at least one
  of the SPEFSCR[FINVH] or SPEFSCR[FINV] bits is set.
- If an overflow occurs or is likely, the SPEFSCR[FOVFH] or SPEFSCR[FOVF] bits is set.
- If an underflow occurs or is likely, at least one of the SPEFSCR[FUNFH] or SPEFSCR[FUNF] bits is set.
- If the exception is enabled for the high or low element in which the error occurs, the exception is taken.

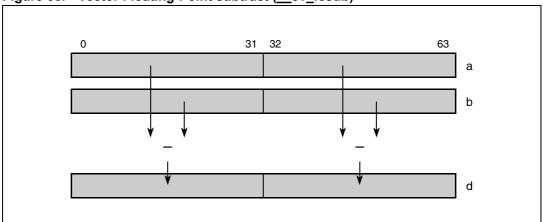

Figure 58. Vector Floating-Point subtract (\_\_ev\_fssub)

Table 64. \_\_ev\_fssub (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evfssub d,a,b

\_\_ev\_ldd PM0045

## \_\_ev\_ldd

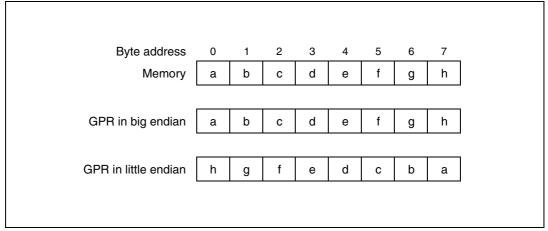

Vector Load Double Word into Double Word

```
d = __ev_ldd (a,b)
if (a = 0) then temp \leftarrow 0
else temp \leftarrow (a)
EA \leftarrow temp + EXTZ(UIMM*8)
d \leftarrow MEM(EA, 8)
```

The double word addressed by EA is loaded from memory and placed in parameter d.

Figure 59 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 59. \_\_ev\_ldd results in big- and little-endian modes

Note:

During implementation, an alignment exception occurs if the effective address (EA) is not double-word aligned.

Table 65. \_\_ev\_ldd (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	5-bit unsigned	evldd d,a,b

PM0045 \_\_ev\_lwhe

#### \_\_ev\_lwhe

Vector Load Word into Two Half Words Even

```
\begin{array}{l} \textbf{d = \_ev\_lwhe (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow 0 \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp} + \textbf{EXTZ (UIMM*4)} \\ \textbf{d}_{0:15} \leftarrow \textbf{MEM (EA,2)} \\ \textbf{d}_{16:31} \leftarrow \textbf{0x0000} \\ \textbf{d}_{32:47} \leftarrow \textbf{MEM (EA+2,2)} \\ \textbf{d}_{48:63} \leftarrow \textbf{0x0000} \end{array}
```

The word addressed by EA is loaded from memory and placed in the even half words in each element of parameter d.

Figure 82 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 82. \_\_ev\_lwhe results in big- and little-endian modes

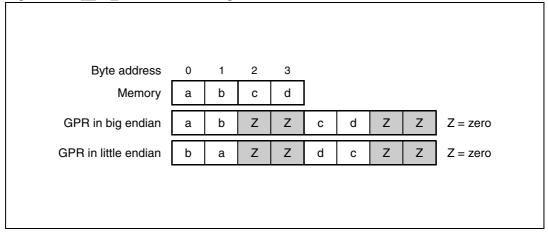

Table 88. \_\_ev\_lwhe (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	5-bit unsigned	evlwhe d,a,b

\_\_ev\_lwhex PM0045

### \_\_ev\_lwhex

Vector Load Word into Two Half Words Even Indexed

```
\begin{array}{l} \textbf{d = \_ev\_lwhex (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow 0 \\ \textbf{else temp} \leftarrow (a) \\ \textbf{EA} \leftarrow \textbf{temp} + (b) \\ \textbf{d}_{0:15} \leftarrow \texttt{MEM(EA,2)} \\ \textbf{d}_{16:31} \leftarrow 0\textbf{x}0000 \\ \textbf{d}_{32:47} \leftarrow \texttt{MEM(EA+2,2)} \\ \textbf{d}_{48:63} \leftarrow 0\textbf{x}0000 \end{array}
```

The word addressed by EA is loaded from memory and placed in the even half words in each element of parameter d.

Figure 83 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 83. \_\_ev\_lwhex results in big- and little-endian modes

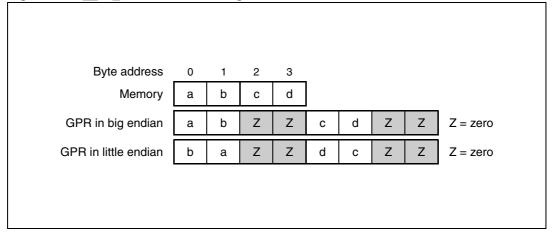

Table 89. \_\_ev\_lwhex (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	int32_t	evlwhex d,a,b

PM0045 ev lwhos

### \_ev\_lwhos

Vector Load Word into Two Half Words Odd Signed (with sign extension)

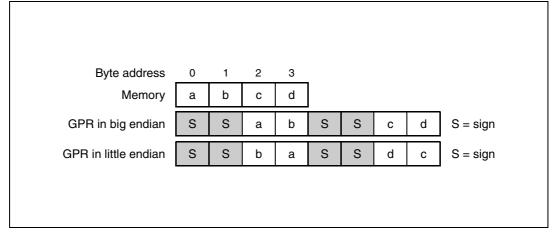

```
\begin{split} \textbf{d} &= \_\texttt{ev\_lwhos} \, (\textbf{a}, \textbf{b}) \\ &\text{if } (\textbf{a} = \textbf{0}) \text{ then } \text{temp} \leftarrow \textbf{0} \\ &\text{else } \text{temp} \leftarrow (\textbf{a}) \\ &\text{EA} \leftarrow \text{temp} + \text{EXTZ} \, (\text{UIMM*4}) \\ &\textbf{d}_{0:31} \leftarrow \text{EXTS} \, (\text{MEM} \, (\text{EA}, \textbf{2})) \\ &\textbf{d}_{32:63} \leftarrow \text{EXTS} \, (\text{MEM} \, (\text{EA}+2, \textbf{2})) \end{split}
```

The word addressed by EA is loaded from memory and placed in the odd half words sign extended in each element of parameter d.

Figure 84 shows how bytes are loaded into parameter d as determined by the endian mode.

- In big-endian memory, the msbs of parameters a and c are sign-extended.
- In little-endian memory, the msbs of parameters b and d are sign-extended.

Figure 84. \_\_ev\_lwhos results in big- and little-endian modes

Note:

Table 90. \_\_ev\_lwhos (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	5-bit unsigned	evlwhos d,a,b

ev lwhosx PM0045

### \_ev\_lwhosx

Vector Load Word into Two Half Words Odd Signed Indexed (with sign extension)

```
\begin{array}{l} \textbf{d = \__ev\_lwhosx (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow \textbf{0} \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp + (b)} \\ \textbf{d}_{0:31} \leftarrow \textbf{EXTS (MEM (EA,2))} \\ \textbf{d}_{32:63} \leftarrow \textbf{EXTS (MEM (EA+2,2))} \end{array}
```

The word addressed by EA is loaded from memory and placed in the odd half words sign extended in each element of parameter d.

Figure 85 shows how bytes are loaded into parameter d as determined by the endian mode.

- In big-endian memory, the msbs of parameters a and c are sign-extended.
- In little-endian memory, the msbs of parameters b and d are sign-extended.

Figure 85. \_\_ev\_lwhosx results in big- and little-endian modes

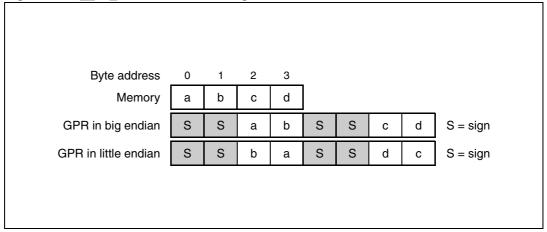

Table 91. \_\_ev\_lwhosx (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	int32_t	evlwhosx d,a,b

PM0045 \_\_ev\_lwhou

### \_\_ev\_lwhou

Vector Load Word into Two Half Words Odd Unsigned (zero-extended)

```
\begin{array}{l} \textbf{d = \_ev\_lwhou (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow 0 \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp} + \textbf{EXTZ (UIMM*4)} \\ \textbf{d}_{0:15} \leftarrow \textbf{0x0000} \\ \textbf{d}_{16:31} \leftarrow \textbf{MEM (EA,2)} \\ \textbf{d}_{32:47} \leftarrow \textbf{0x0000} \\ \textbf{d}_{48:63} \leftarrow \textbf{MEM (EA+2,2)} \end{array}
```

The word addressed by EA is loaded from memory and placed in the odd half words zero extended in each element of parameter d.

Figure 86 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 86. \_\_ev\_lwhou results in big- and little-endian modes

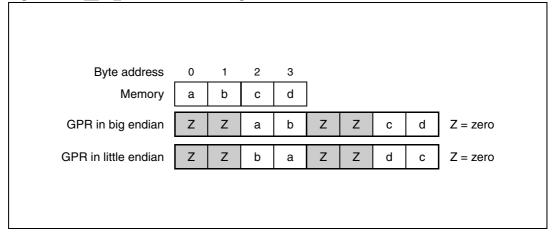

Table 92. \_\_ev\_lwhou (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	5-bit unsigned	evlwhou d,a,b

\_\_ev\_lwhoux PM0045

### \_ev\_lwhoux

Vector Load Word into Two Half Words Odd Unsigned Indexed (zero-extended)

```
\begin{array}{l} \textbf{d = \_ev\_lwhoux (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow \textbf{0} \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp + (b)} \\ \textbf{d}_{0:15} \leftarrow \textbf{0x0000} \\ \textbf{d}_{16:31} \leftarrow \textbf{MEM (EA, 2)} \\ \textbf{d}_{32:47} \leftarrow \textbf{0x0000} \\ \textbf{d}_{48:63} \leftarrow \textbf{MEM (EA+2, 2)} \end{array}
```

The word addressed by EA is loaded from memory and placed in the odd half words zero extended in each element of parameter d.

Figure 87 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 87. \_\_ev\_lwhoux results in big- and little-endian modes

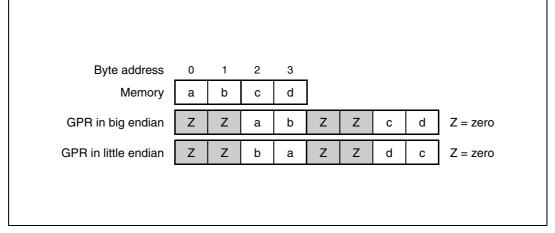

Table 93. \_\_ev\_lwhoux (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	int32_t	evlwhoux d,a,b

PM0045 \_\_ev\_lwhsplat

### \_ev\_lwhsplat

Vector Load Word into Two Half Words and Splat

```
\begin{array}{l} \textbf{d = \_ev\_lwhsplat (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow 0 \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp} + \textbf{EXTZ (UIMM*4)} \\ \textbf{d}_{0:15} \leftarrow \textbf{MEM (EA, 2)} \\ \textbf{d}_{16:31} \leftarrow \textbf{MEM (EA, 2)} \\ \textbf{d}_{32:47} \leftarrow \textbf{MEM (EA+2, 2)} \\ \textbf{d}_{48:63} \leftarrow \textbf{MEM (EA+2, 2)} \end{array}
```

The word addressed by EA is loaded from memory and placed in both the even and odd half words in each element of parameter d.

Figure 88 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 88. \_\_ev\_lwhsplat results in big- and little-endian modes

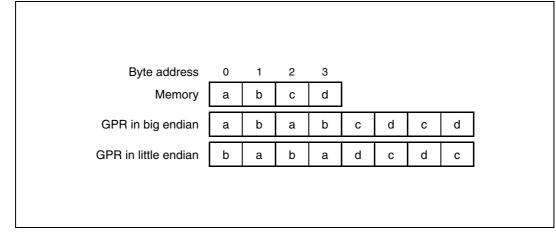

Table 94. \_\_ev\_lwhsplat (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	5-bit unsigned	evlwhsplat d,a,b

\_\_ev\_lwhsplatx PM0045

# \_ev\_lwhsplatx

Vector Load Word into Two Half Words and Splat-Indexed

```
\begin{array}{l} \textbf{d = \_ev\_lwhsplatx (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow 0 \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp + (b)} \\ \textbf{d}_{0:15} \leftarrow \textbf{MEM (EA, 2)} \\ \textbf{d}_{16:31} \leftarrow \textbf{MEM (EA, 2)} \\ \textbf{d}_{32:47} \leftarrow \textbf{MEM (EA+2, 2)} \\ \textbf{d}_{48:63} \leftarrow \textbf{MEM (EA+2, 2)} \end{array}
```

The word addressed by EA is loaded from memory and placed in both the even and odd half words in each element of parameter d.

Figure 89 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 89. \_\_ev\_lwhsplatx results in big- and little-endian modes

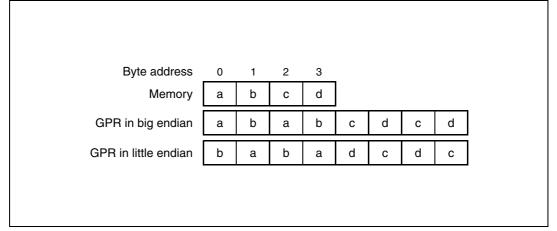

Table 95. \_\_ev\_lwhsplatx (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	int32_t	evlwhsplatx d,a,b

PM0045 \_\_ev\_lwwsplat

### \_ev\_lwwsplat

Vector Load Word into Word and Splat

```
\begin{array}{l} \textbf{d = \_ev\_lwwsplat (a,b)} \\ \textbf{if (a = 0) then temp} \leftarrow 0 \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp} + \textbf{EXTZ(UIMM*4)} \\ \textbf{d}_{0:31} \leftarrow \texttt{MEM(EA,4)} \\ \textbf{d}_{32:63} \leftarrow \texttt{MEM(EA,4)} \end{array}
```

The word addressed by EA is loaded from memory and placed in both elements of parameter d.

Figure 90 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 90. \_\_ev\_lwwsplat results in big- and little-endian modes

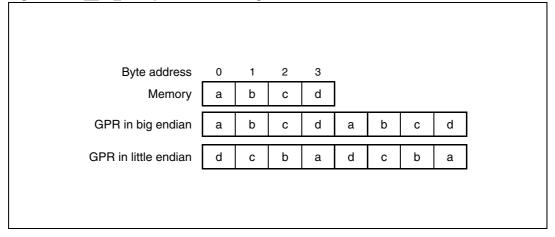

Table 96. \_\_ev\_lwwsplat (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	5-bit unsigned	evlwwsplat d,a,b

\_\_ev\_lwwsplatx PM0045

### \_ev\_lwwsplatx

Vector Load Word into Word and Splat-Indexed

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_lwwsplatx} \ (\textbf{a}, \textbf{b}) \\ \text{if} \ (\textbf{a} = \textbf{0}) \ \ \texttt{then} \ \ \texttt{temp} \leftarrow \textbf{0} \\ \text{else temp} \leftarrow \textbf{(a)} \\ \text{EA} \leftarrow \texttt{temp} + \textbf{(b)} \\ \text{d}_{0:31} \leftarrow \texttt{MEM} \ (\texttt{EA}, \textbf{4}) \\ \text{d}_{32:63} \leftarrow \texttt{MEM} \ (\texttt{EA}, \textbf{4}) \end{split}
```

The word addressed by EA is loaded from memory and placed in both elements of parameter d.

Figure 91 shows how bytes are loaded into parameter d as determined by the endian mode.

Figure 91. \_\_ev\_lwwsplatx results in big- and little-endian modes

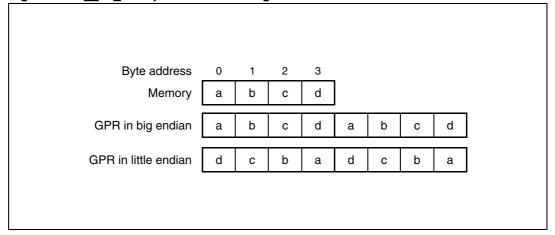

Table 97. \_\_ev\_lwwsplatx (registers altered by).

d	а	b	Maps to
ev64_opaque	uint32_t	int32_t	evlwwsplatx d,a,b

PM0045 \_\_ev\_mergehi

# \_\_ev\_mergehi

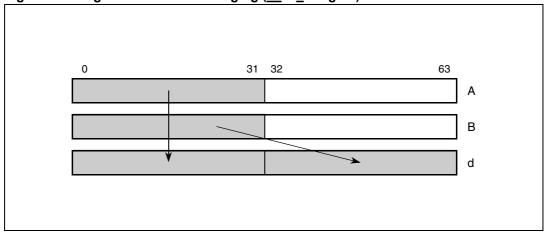

Vector Merge High

d = \_\_ev\_mergehi (a,b)

$$\begin{array}{l} d_{0:31} \leftarrow a_{0:31} \\ d_{32:63} \leftarrow b_{0:31} \end{array}$$

The high-order elements of parameters a and b are merged and placed into parameter d, are shown below:

Figure 92. High-order element merging (\_\_ev\_mergehi)

Note: To perform a vector splat high, specify the same register in parameters a and b.

Table 98. \_\_ev\_mergehi (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmergehi d,a,b

\_\_ev\_mergehilo PM0045

# \_ev\_mergehilo

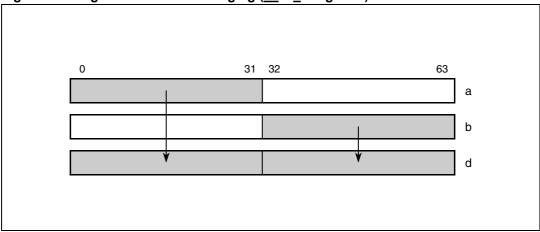

Vector Merge High/Low

d = \_\_ev\_mergehilo (a,b)

$$\begin{array}{l} d_{0:31} \leftarrow a_{0:31} \\ d_{32:63} \leftarrow b_{32:63} \end{array}$$

The high-order element of parameter a and the low-order element of parameter b are merged and placed into parameter d, as shown below:

Figure 93. High-order element merging (\_\_ev\_mergehilo)

Note:

Application note: With appropriate specification of parameter a and b, **evmergehi**, **evmergelo**, **evmergehilo**, and **evmergelohi** provide a full 32-bit permute of two source parameters.

Table 99. \_\_ev\_mergehilo (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmergehilo d,a,b

PM0045 \_\_ev\_mergelo

# \_\_ev\_mergelo

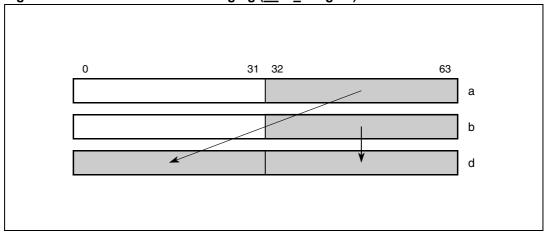

Vector Merge Low

d = \_\_ev\_mergelo (a,b)

$$\begin{array}{l} d_{0:31} \leftarrow a_{32:63} \\ d_{32:63} \leftarrow b_{32:63} \end{array}$$

The low-order elements of parameters a and b are merged and placed in parameter d, as shown below:

Figure 94. Low-order element merging (\_\_ev\_mergelo)

Note: To perform a vector splat low, specify the same register in parameters a and b.

Table 100. \_\_ev\_mergelo (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmergelo d,a,b

\_\_ev\_mergelohi PM0045

# \_ev\_mergelohi

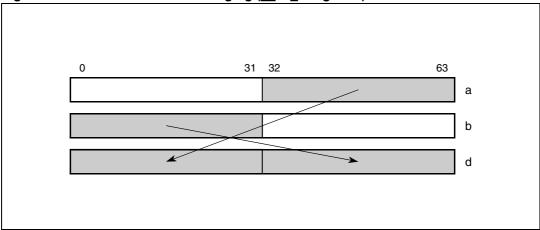

Vector Merge Low/High

d = \_\_ev\_mergelohi (a,b)

$$\begin{array}{c} \textbf{d}_{0:31} \leftarrow \textbf{a}_{32:63} \\ \textbf{d}_{32:63} \leftarrow \textbf{b}_{0:31} \end{array}$$

The low-order element of parameter a and the high-order element of parameter b are merged and placed into parameter d, as shown below:

Figure 95. Low-order element merging (\_\_ev\_mergelohi)

Note: To perform a vector swap, specify the same register in parameters a and b.

Table 101. \_\_ev\_mergelohi (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmergelohi d,a,b

PM0045 \_\_ev\_mhegsmfaa

# \_ev\_mhegsmfaa

Vector Multiply Half Words, Even, Guarded, Signed, Modulo, Fractional and Accumulate

```
\begin{array}{l} \textbf{d = \_ev\_mhegsmfaa (a,b)} \\ \textbf{temp}_{0:31} \leftarrow \textbf{a}_{32:47} \times_{\textbf{sf}} \textbf{b}_{32:47} \\ \textbf{temp}_{0:63} \leftarrow \textbf{EXTS (temp}_{0:31}) \\ \textbf{d}_{0:63} \leftarrow \textbf{ACC}_{0:63} + \textbf{temp}_{0:63} \\ // \ \textbf{update accumulator} \\ \textbf{ACC}_{0:63} \leftarrow \textbf{d}_{0:63} \end{array}
```

The corresponding low even-numbered, half-word signed fractional elements in parameters a and b are multiplied. The product is added to the contents of the 64-bit accumulator, and the result is placed into parameter d and the accumulator.

Note: This sum is a modulo sum. Neither overflow check nor saturation is performed. Any overflow of the 64-bit sum is not recorded into the SPEFSCR.

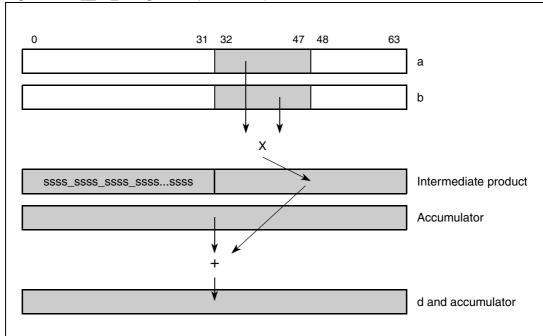

Table 102. \_\_ev\_mhegsmfaa (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmhegsmfaa d,a,b

\_ev\_mhegsmfan PM0045

# \_\_ev\_mhegsmfan

Vector Multiply Half Words, Even, Guarded, Signed, Modulo, Fractional and Accumulate Negative

#### $d = \underline{\quad} ev_mhegsmfan (a,b)$

```
\begin{array}{l} \mathtt{temp}_{0:31} \leftarrow \mathtt{a}_{32:47} \times_{\mathtt{sf}} \mathtt{b}_{32:47} \\ \mathtt{temp}_{0:63} \leftarrow \mathtt{EXTS}(\mathtt{temp}_{0:31}) \\ \mathtt{d}_{0:63} \leftarrow \mathtt{ACC}_{0:63} - \mathtt{temp}_{0:63} \\ // \ \mathtt{update} \ \mathtt{accumulator} \\ \mathtt{ACC}_{0:63} \leftarrow \mathtt{d}_{0:63} \end{array}
```

The corresponding low even-numbered, half-word signed fractional elements in parameters a and b are multiplied. The product is subtracted from the contents of the 64-bit accumulator, and the result is placed into parameter d and the accumulator.

Note:

This difference is a modulo difference. Neither overflow check nor saturation is performed. Any overflow of the 64-bit difference is not recorded into the SPEFSCR.

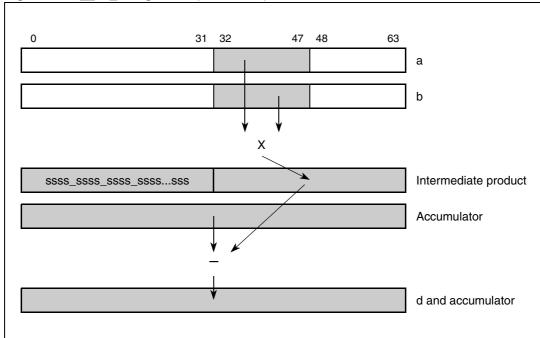

Table 103. \_\_ev\_mhegsmfan (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmhegsmfan d,a,b

PM0045 \_\_ev\_mhegsmiaa

### \_ev\_mhegsmiaa

Vector Multiply Half Words, Even, Guarded, Signed, Modulo, Integer and Accumulate

```
\begin{array}{l} \textbf{d = \__{ev\_mhegsmiaa (a,b)}} \\ \texttt{temp}_{0:31} \leftarrow \texttt{a}_{32:47} \times_{\texttt{si}} \texttt{b}_{32:47} \\ \texttt{temp}_{0:63} \leftarrow \texttt{EXTS (temp}_{0:31}) \\ \texttt{d}_{0:63} \leftarrow \texttt{ACC}_{0:63} + \texttt{temp}_{0:63} \\ \\ // \texttt{update accumulator} \\ \texttt{ACC}_{0:63} \leftarrow \texttt{d}_{0:63} \end{array}
```

The corresponding low even-numbered half-word signed integer elements in parameters a and b are multiplied. The intermediate product is sign-extended and added to the contents of the 64-bit accumulator, and the resulting sum is placed into parameter d and the accumulator.

Note:

This sum is a modulo sum. Neither overflow check nor saturation is performed. Any overflow of the 64-bit sum is not recorded into the SPEFSCR.

Figure 98. \_\_ev\_mhegsmiaa (even form)

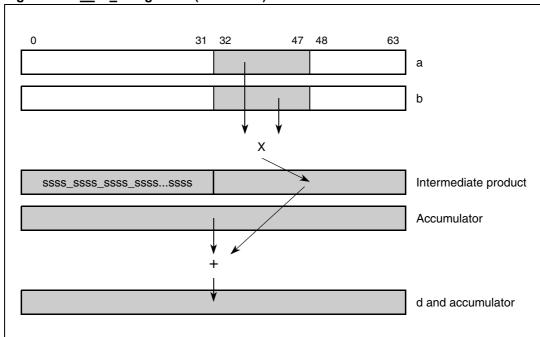

Table 104. \_\_ev\_mhegsmiaa (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evmhegsmiaa d,a,b

\_ev\_mhegsmian PM0045

# \_ev\_mhegsmian

Vector Multiply Half Words, Even, Guarded, Signed, Modulo, Integer and Accumulate Negative

#### d = \_\_ev\_mhegsmian (a,b)

```
\begin{array}{l} \mathsf{temp}_{0:31} \leftarrow \mathsf{a}_{32:47} \times_{\mathtt{si}} \mathsf{b}_{32:47} \\ \mathsf{temp}_{0:63} \leftarrow \mathsf{EXTS}(\mathsf{temp}_{0:31}) \\ \mathsf{d}_{0:63} \leftarrow \mathsf{ACC}_{0:63} - \mathsf{temp}_{0:63} \\ // \ \mathsf{update} \ \mathsf{accumulator} \end{array}
```

 $\mathtt{ACC}_{0:63} \leftarrow \mathtt{d}_{0:63}$  The corresponding low even-numbered half-word signed integer elements in parameters a and b are multiplied. The intermediate product is sign-extended and subtracted from the contents of the 64-bit accumulator, and the result is placed into parameter d and into the accumulator.

Note:

This difference is a modulo difference. Neither overflow check nor saturation is performed. Any overflow of the 64-bit difference is not recorded into the SPEFSCR.

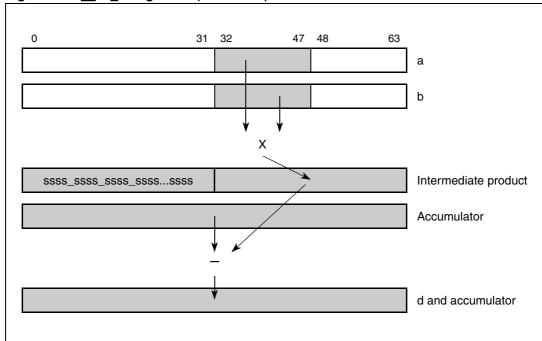

Table 105. \_\_ev\_mhegsmian (registers altered by).

```

```
\begin{array}{l} \mathtt{temp_{0:31}} \leftarrow \mathtt{a_{32:47}} \times_{\mathtt{ui}} \mathtt{b_{32:47}} \\ \mathtt{temp_{0:63}} \leftarrow \mathtt{EXTZ}(\mathtt{temp_{0:31}}) \\ \mathtt{d_{0:63}} \leftarrow \mathtt{ACC_{0:63}} - \mathtt{temp_{0:63}} \\ // \mathtt{update} \mathtt{\ accumulator} \\ \mathtt{ACC_{0:63}} \leftarrow \mathtt{d_{0:63}} \end{array}
```

The corresponding low even-numbered elements in parameters a and b are multiplied. The intermediate product is zero-extended and subtracted from the contents of the 64-bit accumulator. The result is placed into parameter d and into the accumulator.

Note:

This difference is a modulo difference. Neither overflow check nor saturation is performed. Overflow of the 64-bit difference is not recorded into the SPEFSCR.

\begin{array}{l} \mathsf{temp}_{0:31} \leftarrow \mathsf{a_{48:63}} \times_{ui} \mathsf{b_{48:63}} \\ \mathsf{temp}_{0:63} \leftarrow \mathsf{EXTZ}(\mathsf{temp}_{0:31}) \\ \mathsf{d_{0:63}} \leftarrow \mathsf{ACC}_{0:63} - \mathsf{temp}_{0:63} \\ // \ \mathsf{update} \ \mathsf{accumulator} \\ \mathsf{ACC}_{0:63} \leftarrow \mathsf{d_{0:63}} \end{array}
```

The corresponding low odd-numbered half word elements in parameters a and b are multiplied. The intermediate product is zero-extended to 64 bits and subtracted from the contents of the 64-bit accumulator. This result is placed into parameter d and into the accumulator.

Note:

This difference is a modulo difference. Neither overflow check nor saturation is performed. Overflow of the 64-bit difference is not recorded into the SPEFSCR.

PM0045 ev mwlssiaaw

## \_ev\_mwlssiaaw

Vector Multiply Word Low Signed, Saturate, Integer and Accumulate in Words

```
d = __ev_mwlssiaaw (a,b)
// high
\texttt{temp}_{\texttt{0:63}} \leftarrow \texttt{a}_{\texttt{0:31}} \times_{\texttt{si}} \texttt{b}_{\texttt{0:31}}
\texttt{temp}_{\texttt{0:63}} \leftarrow \texttt{EXTS}\left(\texttt{ACC}_{\texttt{0:31}}\right) \ + \ \texttt{EXTS}\left(\texttt{temp}_{\texttt{32:63}}\right)
\texttt{ovh} \, \leftarrow (\texttt{temp}_{31} \, \oplus \, \texttt{temp}_{32})
\mathbf{d_{0:31}} \leftarrow \mathtt{SATURATE}(\mathtt{ovh,\ temp_{31}},\ \mathtt{0x8000\_0000},\ \mathtt{0x7FFF\_FFF},\ \mathtt{temp_{32:63}})
// low
\mathtt{temp}_{\texttt{0:63}} \leftarrow \mathtt{a}_{\texttt{32:63}} \times_{\mathtt{si}} \mathtt{b}_{\texttt{32:63}}
\texttt{temp}_{\texttt{0:63}} \leftarrow \texttt{EXTS}\left(\texttt{ACC}_{\texttt{32:63}}\right) \ + \ \texttt{EXTS}\left(\texttt{temp}_{\texttt{32:63}}\right)
\texttt{ovl} \leftarrow (\texttt{temp}_{31} \, \oplus \, \texttt{temp}_{32})
\texttt{d}_{\texttt{32:63}} \leftarrow \texttt{SATURATE}(\texttt{ovl, temp}_{\texttt{31}}, \texttt{0x8000\_0000}, \texttt{0x7FFF\_FFFF}, \texttt{temp}_{\texttt{32:63}})
// update accumulator
\mathtt{ACC_{0:63}} \leftarrow \mathtt{d_{0:63}}
// update SPEFSCR
\mathtt{SPEFSCR}_{\mathtt{OVH}} \leftarrow \mathtt{ovh}
\mathtt{SPEFSCR}_{\mathtt{OV}} \, \leftarrow \mathtt{ovl}
```

The corresponding word signed integer elements in parameters a and b are multiplied, producing a 64-bit product. The least significant 32 bits of each product are then added to the corresponding word in the accumulator, saturating if overflow or underflow occurs, and the result is placed in parameter d and the accumulator.

If there is an overflow or underflow from the addition, the overflow and summary overflow bits are recorded in the SPEFSCR.

Other registers altered: SPEFSCR ACC

 $\begin{aligned} \mathtt{SPEFSCR}_{\mathtt{SOVH}} &\leftarrow \mathtt{SPEFSCR}_{\mathtt{SOVH}} &\mid \mathtt{ovh} \\ \mathtt{SPEFSCR}_{\mathtt{SOV}} &\leftarrow \mathtt{SPEFSCR}_{\mathtt{SOV}} &\mid \mathtt{ovl} \end{aligned}$

```
d = \underline{\quad} ev_mwssf(a,b)
                                                                           (A = 0)
d = __ev_mwssfa (a,b)
                                                                           )A = 1)
\texttt{temp}_{\texttt{0:63}} \, \leftarrow \texttt{a}_{\texttt{32:63}} \, \times_{\texttt{sf}} \, \texttt{b}_{\texttt{32:63}}
if (a_{32:63} = 0x8000\_0000) & (b_{32:63} = 0x8000\_0000) then
     d_{\text{0:63}} \, \leftarrow \text{0x7FFF\_FFFF\_FFFF} \, // \text{saturate}
     \texttt{mov} \; \leftarrow \texttt{1}
else
     \texttt{d}_{\texttt{0:63}} \, \leftarrow \texttt{temp}_{\texttt{0:63}}
     \texttt{mov} \; \leftarrow 0
// update accumulator
if A = 1 then ACC_{0:63} \leftarrow d_{0:63}
// update SPEFSCR
\mathtt{SPEFSCR}_{\mathtt{OVH}} \; \leftarrow 0
\mathtt{SPEFSCR}_{\mathtt{OV}} \, \leftarrow \mathtt{mov}
SPEFSCR_{SOV} \leftarrow SPEFSCR_{SOV} \mid mov
```

The low word signed fractional elements in parameters a and b are multiplied. The 64-bit product is placed into parameter d. If both inputs are -1.0, the result saturates to the largest positive signed fraction, and the overflow and summary overflow bits are recorded in the SPEFSCR.

If A = 1, the result in parameter d is also placed into the accumulator.

Other registers altered: SPEFSCR ACC (if A = 1)

### \_ev\_mwssfaa

Vector Multiply Word Signed, Saturate, Fractional and Accumulate

```
d = \underline{\quad} ev_mwssfaa(a,b)
temp_{0:63} \leftarrow a_{32:63} \times_{sf} b_{32:63}
if (a_{32:63} = 0x8000\_0000) & (b_{32:63} = 0x8000\_0000) then
     \texttt{temp}_{0:63} \leftarrow \texttt{0x7FFF\_FFFF\_FFFF} // \texttt{saturate}
     mov \leftarrow 1
else
     \texttt{mov} \; \leftarrow 0
\texttt{temp}_{0:64} \leftarrow \texttt{EXTS}\left(\texttt{ACC}_{0:63}\right) + \texttt{EXTS}\left(\texttt{temp}_{0:63}\right)
\texttt{ov} \leftarrow (\texttt{temp}_0 \, \oplus \, \texttt{temp}_1)
d_{0:63} \leftarrow temp_{1:64})
// update accumulator
\mathtt{ACC_{0:63}} \leftarrow \mathtt{d_{0:63}}
// update SPEFSCR
\mathtt{SPEFSCR}_{\mathtt{OVH}} \; \leftarrow 0
\mathtt{SPEFSCR}_{\mathtt{OV}} \leftarrow \mathtt{mov}
\mathtt{SPEFSCR}_{\mathtt{SOV}} \, \leftarrow \mathtt{SPEFSCR}_{\mathtt{SOV}} \, \mid \, \mathtt{ov} \, \mid \, \mathtt{mov}
```

The low word signed fractional elements in parameters a and b are multiplied, producing a 64-bit product. If both inputs are -1.0, the product saturates to the largest positive signed fraction. The 64-bit product is added to the accumulator, and the result is placed in parameter d and in the accumulator.

If there is an overflow from the multiply, the overflow and summary overflow bits are recorded in the SPEFSCR.

Note: There is no

There is no saturation on the addition with the accumulator.

Other registers altered: SPEFSCR ACC

PM0045 \_\_ev\_mwssfan

### \_ev\_mwssfan

Vector Multiply Word Signed, Saturate, Fractional and Accumulate Negative

```
d = \underline{\quad} ev_mwssfan(a,b)
temp_{0:63} \leftarrow a_{32:63} \times_{sf} b_{32:63}
if (a_{32:63} = 0x8000\_0000) & (b_{32:63} = 0x8000\_0000) then
     \texttt{temp}_{\texttt{0:63}} \leftarrow \texttt{0x7FFF\_FFFF\_FFFF} // \texttt{saturate}
     mov \leftarrow 1
else
     \texttt{mov} \; \leftarrow 0
\texttt{temp}_{0:64} \leftarrow \texttt{EXTS}(\texttt{ACC}_{0:63}) \text{ - EXTS}(\texttt{temp}_{0:63})
ov \leftarrow (temp_0 \oplus temp_1)
d_{0:63} \leftarrow temp_{1:64}
// update accumulator
\mathtt{ACC_{0:63}} \leftarrow \mathtt{d_{0:63}}
// update SPEFSCR
\mathtt{SPEFSCR}_{\mathtt{OVH}} \; \leftarrow 0
\mathtt{SPEFSCR}_{\mathtt{OV}} \, \leftarrow \mathtt{mov}
\mathtt{SPEFSCR}_{\mathtt{SOV}} \leftarrow \mathtt{SPEFSCR}_{\mathtt{SOV}} \ | \ \mathtt{ov} \ | \ \mathtt{mov}
```

The low word signed fractional elements in parameters a and b are multiplied producing a 64-bit product. If both inputs are -1.0, the product saturates to the largest positive signed fraction. The 64-bit product is then subtracted from the accumulator and the result is placed in parameter d and the accumulator.

If there is an overflow from the multiply, the overflow and summary overflow bits are recorded in the SPEFSCR.

Note: There is no saturation on the subtraction with the accumulator.

Other registers altered: SPEFSCR ACC

PM0045 \_\_ev\_neg

### \_\_ev\_neg

Vector Negate

$$\begin{aligned} & \textbf{d} = \underline{\quad} \textbf{ev\_neg(a)} \\ & \textbf{d}_{0:31} \leftarrow \texttt{NEG(a}_{0:31}) \\ & \textbf{d}_{32:63} \leftarrow \texttt{NEG(a}_{32:63}) \end{aligned}$$

The negative of each element of parameter a is placed in parameter d. The negative of 0x8000\_0000 (most negative number) returns 0x8000\_0000. No overflow is detected.

Figure 182. Vector negate (\_\_ev\_neg)

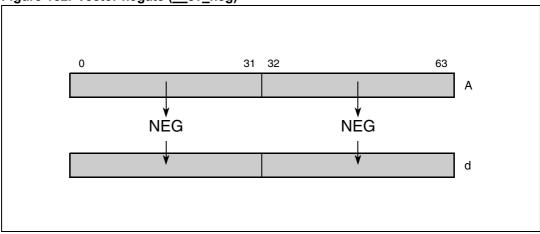

Table 189. \_\_ev\_neg (registers altered by).

Maps to	а	d
ue <b>evneg d,a,b</b>	ev64_opaque	ev64_opaque

\_\_ev\_nor PM0045

### \_\_ev\_nor

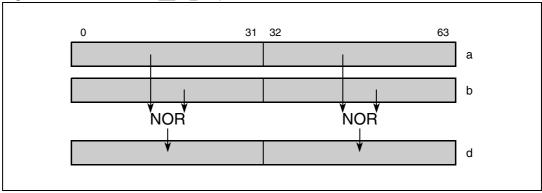

Vector NOR

$$\begin{array}{l} \textbf{d = \_ev\_nor (a,b)} \\ \textbf{d}_{0:31} \leftarrow \neg (\textbf{a}_{0:31} \ | \ \textbf{b}_{0:31}) \ // \ \textbf{Bitwise NOR} \\ \textbf{d}_{32:63} \leftarrow \neg (\textbf{a}_{32:63} \ | \ \textbf{b}_{32:63}) \ // \ \textbf{Bitwise NOR} \end{array}$$

Each element of parameters a and b is bitwise NORed. The result is placed in the corresponding element of parameter d.

Note: Use evnand or evnor for evnot.

Figure 183. Vector NOR (\_\_ev\_nor)

Simplified mnemonic: evnot d,a performs a complement register.

evnot d,a equivalent to evnor d,a,a

Table 190. \_\_ev\_nor (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evnor d,a,b

PM0045 \_\_ev\_or

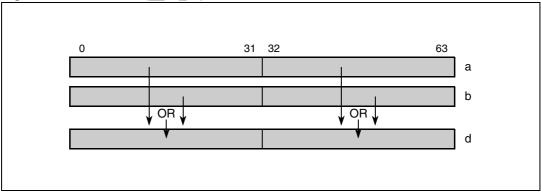

### \_\_ev\_or

Vector OR

$$\begin{array}{l} \textbf{d = \_ev\_or (a,b)} \\ \textbf{d}_{0:31} \leftarrow \textbf{a}_{0:31} \ | \ \textbf{b}_{0:31} \ // \textbf{Bitwise OR} \\ \textbf{d}_{32:63} \leftarrow \textbf{a}_{32:63} \ | \ \textbf{b}_{32:63} // \ \textbf{Bitwise OR} \end{array}$$

Each element of parameters a and b is bitwise ORed. The result is placed in the corresponding element of parameter d.

Figure 184. Vector OR (\_\_ev\_or)

Simplified mnemonic: **evmr** d,a handles moving of the full 64-bit SPE register.

Table 191. \_\_ev\_or (registers altered by).

evmr d,a

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evor d,a,b

equivalent to

evor d,a,a

### \_\_ev\_orc

Vector OR with Complement

```
\begin{array}{l} \textbf{d = \_ev\_orc (a,b)} \\ \textbf{d}_{0:31} \leftarrow \textbf{a}_{0:31} \ | \ (\neg \textbf{b}_{0:31}) \ // \ \textbf{Bitwise ORC} \\ \textbf{d}_{32:63} \leftarrow \textbf{a}_{32:63} \ | \ (\neg \textbf{b}_{32:63}) \ // \ \textbf{Bitwise ORC} \end{array}
```

Each element of parameter a is bitwise ORed with the complement of parameter b. The result is placed in the corresponding element of parameter d.

Figure 185. Vector OR with complement (\_\_ev\_orc)

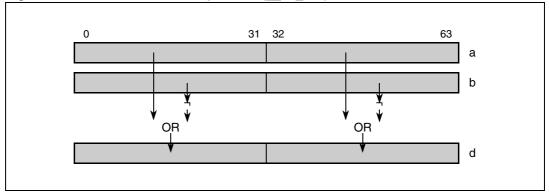

Table 192. \_\_ev\_orc (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evorc d,a,b

PM0045 \_\_ev\_rlw

# \_\_ev\_rlw

Vector Rotate Left Word

```
\begin{aligned} & \textbf{d} = \_\textbf{ev}_{\textbf{r}} \textbf{Iw}(\textbf{a}, \textbf{b}) \\ & \text{nh} & \leftarrow \textbf{b}_{27:31} \\ & \text{nl} & \leftarrow \textbf{b}_{59:63} \\ & \textbf{d}_{0:31} & \leftarrow \texttt{ROTL}(\textbf{a}_{0:31}, \textbf{nh}) \\ & \textbf{d}_{32:63} & \leftarrow \texttt{ROTL}(\textbf{a}_{32:63}, \textbf{nl}) \end{aligned}
```

Each of the high and low elements of parameter a is rotated left by an amount specified in parameter b. The result is placed into parameter d. Rotate values for each element of parameter a are found in bit positions b[27–31] and b[59–63].

Figure 186. Vector rotate left word (\_\_ev\_rlw)

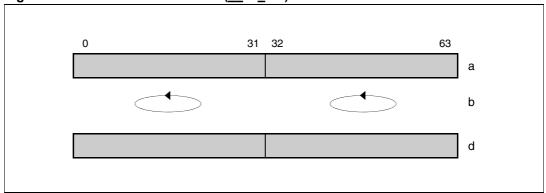

Table 193. \_\_ev\_rlw (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evrlw d,a,b

\_\_ev\_rlwi PM0045

# \_\_ev\_rlwi

Vector Rotate Left Word Immediate

```
\begin{aligned} & \textbf{d} = \_ev\_rlwi \ (a,b) \\ & n \ \leftarrow \texttt{UIMM} \\ & d_{0:31} \ \leftarrow \texttt{ROTL} \ (a_{0:31}, \ n) \\ & d_{32:63} \ \leftarrow \texttt{ROTL} \ (a_{32:63}, \ n) \end{aligned}
```

Both the high and low elements of parameter a are rotated left by an amount specified by a 5-bit immediate value.

Figure 187. Vector rotate left word immediate (\_\_ev\_rlwi)

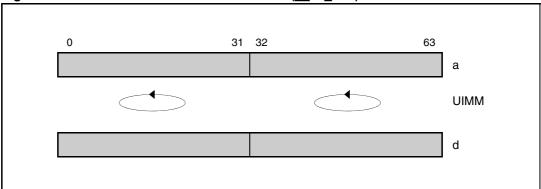

Table 194. \_\_ev\_rlwi (registers altered by).

d a		b	Maps to
ev64_opaque	ev64_opaque	5-bit unsigned	evrlwi d,a,b

PM0045 \_\_ev\_rndw

# \_\_ev\_rndw

Vector Round Word

#### $d = \underline{\quad} ev_rndw(a)$

```
\begin{array}{l} d_{0:31} \leftarrow (a_{0:31} + 0x00008000) \text{ \& 0xFFFF0000 // Modulo sum} \\ d_{32:63} \leftarrow (a_{32:63} + 0x00008000) \text{ \& 0xFFFF0000 // Modulo sum} \end{array}
```

The 32-bit elements of parameter a are rounded into 16 bits. The result is placed into parameter d. The resulting 16 bits are placed in the most significant 16 bits of each element of parameter d, zeroing out the low order 16 bits of each element.

Figure 188. Vector round word (\_\_ev\_rndw)

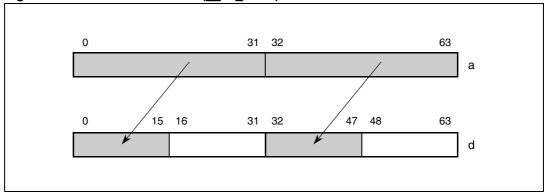

Table 195. \_\_ev\_rndw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evrndw d,a

\_\_ev\_select\_eq PM0045

### \_ev\_select\_eq

Vector Select Equal

```
\begin{array}{lll} e = \_\_ev\_select\_eq(a,b,c,d) \\ \text{if} & (a_{0:31} = b_{0:31}) \text{ then } e_{0:31} \leftarrow c_{0:31} \\ \text{else } e_{0:31} \leftarrow d_{0:31} \\ \text{if } & (a_{32:63} = b_{32:63}) \text{ then } e_{32:63} \leftarrow c_{32:63} \\ \text{else } e_{32:63} \leftarrow d_{32:63} \end{array}
```

This intrinsic returns a concatenated value of the upper and lower bits of parameters c or d based on the sizes of the upper and lower bits of parameters a and b. The  $\__ev_select_*$  functions work like the ? : operator in C. For example, the aforementioned intrinsic maps to the following logical expression: a = b? c: d.

Figure 189. Vector select equal (\_\_ev\_select\_eq)

\begin{array}{l} \textbf{e} = \_\textbf{ev\_select\_fs\_tst\_lt(a,b,c,d)} \\ \textbf{if} \quad (a_{0:31} < b_{0:31}) \quad \textbf{then} \ e_{0:31} \leftarrow c_{0:31} \\ \textbf{else} \ e_{0:31} \leftarrow d_{0:31} \\ \textbf{if} \ (a_{32:63} < b_{32:63}) \quad \textbf{then} \ e_{32:63} \leftarrow c_{32:63} \\ \textbf{else} \ e_{32:63} \leftarrow d_{32:63} \end{array}
```

This intrinsic returns a concatenated value of the upper and lower bits of parameter c or d based on the sizes of the upper and lower bits of parameters a and b. The \_\_ev\_select\_\* functions work like the ? : operator in C. For example, the aforementioned intrinsic maps to the following logical expression: a < b? c : d. This intrinsic differs from \_\_ev\_select\_fs\_lt because no exceptions are taken during its execution. If strict IEEE 754 compliance is required, use \_\_ev\_select\_fs\_lt instead.

Figure 195. Vector select Floating-Point test less than (\_\_ev\_select\_fs\_tst\_lt)

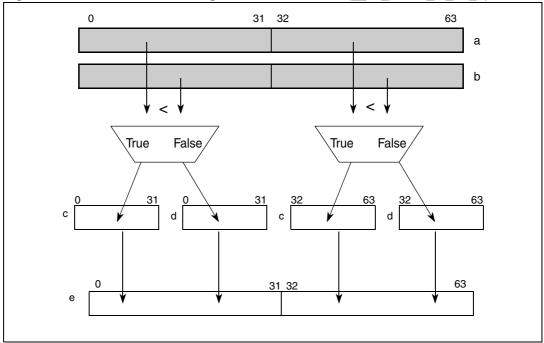

Table 202. \_\_ev\_select\_fs\_tst\_lt (registers altered by).

PM0045 \_\_ev\_select\_gts

## \_\_ev\_select\_gts

Vector Select Greater Than Signed

```
\begin{array}{l} \textbf{e} = \_\textbf{ev\_select\_gts(a,b,c,d)} \\ \textbf{if} \quad (a_{0:31} >_{\texttt{signed}} b_{0:31}) \quad \textbf{then} \ e_{0:31} \leftarrow c_{0:31} \\ \textbf{else} \ e_{0:31} \leftarrow d_{0:31} \\ \textbf{if} \ (a_{32:63} >_{\texttt{signed}} b_{32:63}) \quad \textbf{then} \ e_{32:63} \leftarrow c_{32:63} \\ \textbf{else} \ e_{32:63} \leftarrow d_{32:63} \end{array}
```

This intrinsic returns a concatenated value of the upper and lower bits of parameter c or d based on the sizes of the upper and lower bits of parameters a and b. The  $\__ev_select_*$  functions work like the ? : operator in C. For example, the aforementioned intrinsic maps to the following logical expression: a > b? c : d.

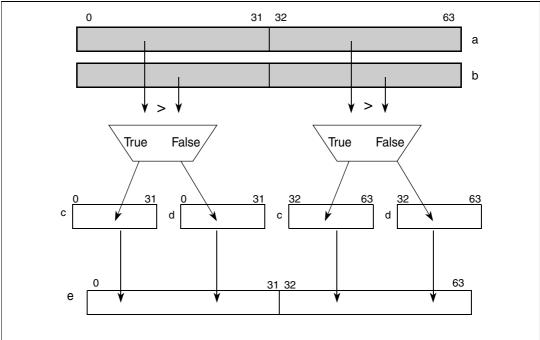

Table 203. \_\_ev\_select\_gts (registers altered by).

	е	а	b	С	d	Maps to
1	ev64_opaque	ev64_opaque	ev64_opaque	ev64_opaque	ev64_opaque	evcmpgts x,a,b evsel e,c,d,x

\_\_ev\_select\_gtu PM0045

## \_\_ev\_select\_gtu

Vector Select Greater Than Unsigned

```
\begin{array}{lll} \textbf{e} = & \_\textbf{ev\_select\_gtu(a,b,c,d)} \\ \textbf{if} & (a_{0:31} > _{unsigned} c_{0:31}) & then \ e_{0:31} \leftarrow c_{0:31} \\ \textbf{else} \ e_{0:31} \leftarrow d_{0:31} \\ \textbf{if} & (a_{32:63} > _{unsigned} b_{32:63}) & then \ e_{32:63} \leftarrow c_{32:63} \\ \textbf{else} \ e_{32:63} \leftarrow d_{32:63} \end{array}
```

This intrinsic returns a concatenated value of the upper and lower bits of parameter c or d based on the sizes of the upper and lower bits of parameters a and b. The  $\__ev_select_*$  functions work like the ? : operator in C. For example, the aforementioned intrinsic maps to the following logical expression: a > b? c : d.

Figure 197. Vector select greater than unsigned (\_\_ev\_select\_gtu)

ev64_opaque	ev64_opaque	ev64_opaque	ev64_opaque	ev64 opaque	evcmplts x,a,b evsel e,c,d,x

\_\_ev\_select\_ltu PM0045

# \_ev\_select\_ltu

Vector Select Less Than Unsigned

```
\begin{array}{l} \textbf{e} = \_\textbf{ev\_select\_ltu}(\textbf{a},\textbf{b},\textbf{c},\textbf{d}) \\ \textbf{if} \quad (\textbf{a}_{0:31} <<_{unsigned} \ \textbf{b}_{0:31}) \quad \textbf{then} \ \textbf{e}_{0:31} \leftarrow \textbf{c}_{0:31} \\ \textbf{else} \ \textbf{e}_{0:31} \leftarrow \textbf{d}_{0:31} \\ \textbf{if} \quad (\textbf{a}_{32:63} <_{unsigned} \ \textbf{b}_{32:63}) \quad \textbf{then} \ \textbf{e}_{32:63} \leftarrow \textbf{c}_{32:63} \\ \textbf{else} \ \textbf{e}_{32:63} \leftarrow \textbf{d}_{32:63} \end{array}
```

This intrinsic returns a concatenated value of the upper and lower bits of parameter c or d based on the sizes of the upper and lower bits of parameters a and b. The  $\__ev_select_*$  functions work like the ? : operator in C. For example, the aforementioned intrinsic maps to the following logical expression: a < b? c : d.

Figure 199. Vector select less than unsigned (\_\_ev\_select\_ltu)

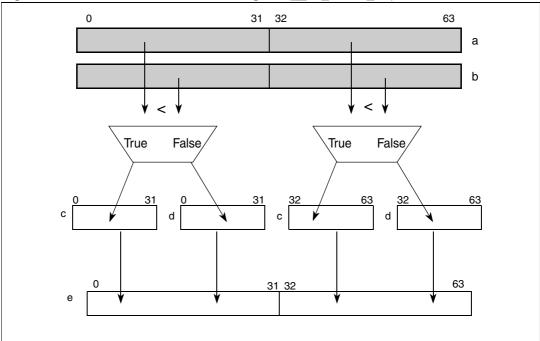

Table 206. \_\_ev\_select\_ltu (registers altered by).

е	а	b	С	d	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	ev64_opaque	ev64_opaque	evcmpltu x,a,b evsel e,c,d,x

PM0045 \_\_ev\_slw

# \_\_ev\_slw

Vector Shift Left Word

```
\begin{aligned} & \textbf{d} = \_\textbf{ev\_slw} \ (\textbf{a}, \textbf{b}) \\ & \text{nh} \ \leftarrow \textbf{b}_{26:31} \\ & \text{nl} \ \leftarrow \textbf{b}_{58:63} \\ & \textbf{d}_{0:31} \ \leftarrow \text{SL} (\textbf{a}_{0:31}, \ \textbf{nh}) \\ & \textbf{d}_{32:63} \ \leftarrow \text{SL} (\textbf{a}_{32:63}, \ \textbf{nl}) \end{aligned}
```

Each of the high and low elements of parameter a are shifted left by an amount specified in parameter b. The result is placed into parameter d. The separate shift amounts for each element are specified by 6 bits in parameter b that lie in bit positions 26–31 and 58–63.

Shift amounts from 32 to 63 give a zero result.

Figure 200. Vector shift left word (\_\_ev\_slw)

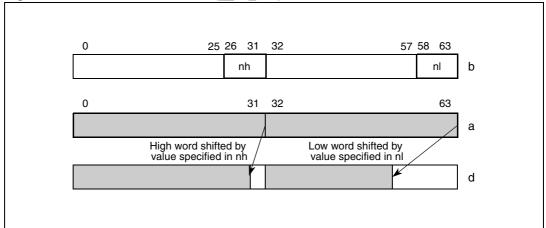

Table 207. \_\_ev\_slw (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evslw d,a,b

\_\_ev\_slwi PM0045

# \_\_ev\_slwi

Vector Shift Left Word Immediate

```
\begin{aligned} & \textbf{d} = \underline{\quad} \textbf{ev\_slwi (a,b)} \\ & \textbf{n} \leftarrow \textbf{UIMM} \\ & \textbf{d}_{0:31} \leftarrow \textbf{SL}(\textbf{a}_{0:31}, \textbf{n}) \\ & \textbf{d}_{32:63} \leftarrow \textbf{SL}(\textbf{a}_{32:63}, \textbf{n}) \end{aligned}
```

Both high and low elements of parameter a are shifted left by the 5-bit UIMM value, and the results are placed in parameter d.

Figure 201. Vector shift left word immediate (\_\_ev\_slwi)

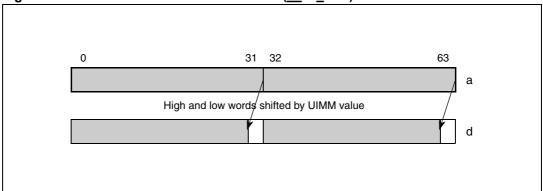

Table 208. \_\_ev\_slwi (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	5-bit unsigned	evslwi d,a,b

PM0045 \_\_ev\_splatfi

## \_\_ev\_splatfi

Vector Splat Fractional Immediate

$$\begin{array}{l} \textbf{d} = \_\texttt{ev\_splatfi(a)} \\ \textbf{d}_{0:31} \leftarrow \texttt{SIMM} \ | \ | \ |^{27}\textbf{0} \\ \textbf{d}_{32:63} \leftarrow \texttt{SIMM} \ | \ | \ |^{27}\textbf{0} \end{array}$$

The 5-bit immediate value is padded with trailing zeros and placed in both elements of parameter d, as shown in *Figure 202*. The SIMM ends up in bit positions d[0–4] and d[32–36].

Figure 202. Vector splat fractional immediate (\_\_ev\_splatfi)

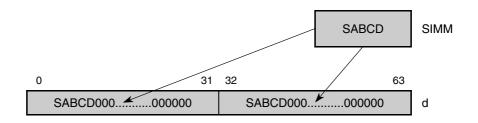

Table 209. \_\_ev\_splatfi (registers altered by).

d	а	Maps to	
ev64_opaque	5-bit signed	evsplatfi d,a	

\_ev\_splati PM0045

# \_\_ev\_splati

Vector Splat Immediate

 $\begin{aligned} & \textbf{d} = \underline{\quad} \textbf{ev\_splati (a)} \\ & \textbf{d}_{0:31} \leftarrow \texttt{EXTS (SIMM)} \\ & \textbf{d}_{32:63} \leftarrow \texttt{EXTS (SIMM)} \end{aligned}$ 

The 5-bit immediate value is sign-extended and placed in both elements of parameter d, as shown in *Figure 203*.

Figure 203. \_\_ev\_splati sign extend

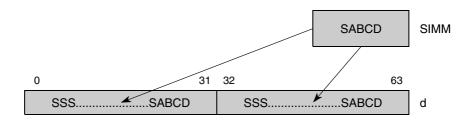

Table 210. \_\_ev\_splati (registers altered by).

d a		Maps to	
ev64_opaque	5-bit signed	evsplati d,a	

PM0045 \_\_ev\_srwis

### \_\_ev\_srwis

Vector Shift Right Word Immediate Signed

```
\begin{aligned} &\textbf{d} = \_\textbf{ev\_srwis(a,b)} \\ &\textbf{n} &\leftarrow \textbf{UIMM} \\ &\textbf{d}_{0:31} &\leftarrow \textbf{EXTS (a}_{0:31-n}) \\ &\textbf{d}_{32:63} &\leftarrow \textbf{EXTS (b}_{32:63-n}) \end{aligned}
```

Both high and low elements of parameter a are shifted right by the 5-bit UIMM value. Bits in the most significant positions vacated by the shift are filled with a copy of the sign bit.

Figure 204. Vector shift right word immediate signed (\_\_ev\_srwis)

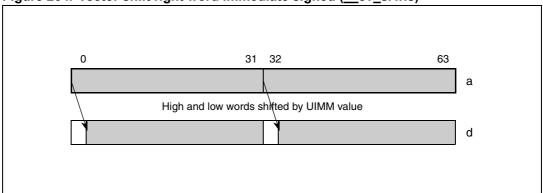

Table 211. \_\_ev\_srwis (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	5-bit unsigned	evsrwis d,a,b

## \_\_ev\_srwiu

Vector Shift Right Word Immediate Unsigned

$$\begin{aligned} & \textbf{d} = \_ev\_srwiu(a,b) \\ & n \leftarrow \texttt{UIMM} \\ & d_{0:31} \leftarrow \texttt{EXTZ} \ (a_{0:31-n}) \\ & d_{32:63} \leftarrow \texttt{EXTZ} \ (a_{32:63-n}) \end{aligned}$$

Both high and low elements of parameter a are shifted right by the 5-bit UIMM value; 0 bits are shifted in to the most significant position. Bits in the most significant positions vacated by the shift are filled with a zero bit.

Figure 205. Vector shift right word immediate unsigned (\_\_ev\_srwiu)

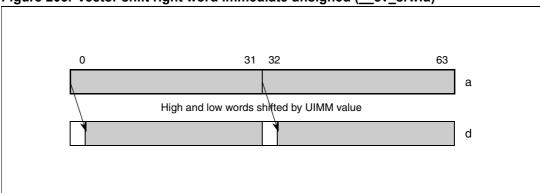

Table 212. \_\_ev\_srwiu (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	5-bit unsigned	evsrwiu d,a,b

PM0045 \_\_ev\_srws

### \_ev\_srws

Vector Shift Right Word Signed

```
\begin{aligned} & \textbf{d} = \_\texttt{ev\_srws} \ (\textbf{a}, \textbf{b}) \\ & \text{nh} \ \leftarrow \textbf{b}_{26:31} \\ & \text{nl} \ \leftarrow \textbf{b}_{58:63} \\ & \textbf{d}_{0:31} \ \leftarrow \texttt{EXTS} \ (\textbf{a}_{0:31-\text{nh}}) \\ & \textbf{d}_{32:63} \ \leftarrow \texttt{EXTS} \ (\textbf{a}_{32:63-\text{nl}}) \end{aligned}
```

Both the high and low elements of parameter a are shifted right by an amount specified in parameter b. The result is placed into parameter d. The separate shift amounts for each element are specified by 6 bits in parameter b that lie in bit positions 26–31 and 58–63. The sign bits are shifted in to the most significant position.

Shift amounts from 32 to 63 give a result of 32 sign bits.

Figure 206. Vector shift right word signed (\_\_ev\_srws)

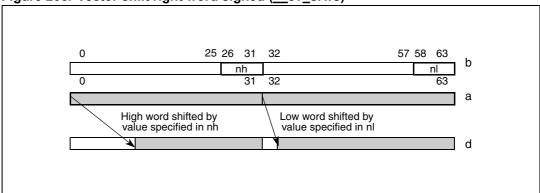

Table 213. \_\_ev\_srws (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evsrws d,a,b

\_\_ev\_srwu PM0045

#### \_\_ev\_srwu

Vector Shift Right Word Unsigned

```
\begin{aligned} & \textbf{d} = \_\texttt{ev\_srwu (a,b)} \\ & \text{nh } \leftarrow b_{26:31} \\ & \text{nl } \leftarrow b_{58:63} \\ & \textbf{d}_{0:31} \leftarrow \texttt{EXTZ (a}_{0:31-nh}) \\ & \textbf{d}_{32:63} \leftarrow \texttt{EXTZ (a}_{32:63-nl}) \end{aligned}
```

Both the high and low elements of parameter a are shifted right by an amount specified in parameter b. The result is placed into parameter d. The separate shift amounts for each element are specified by 6 bits in parameter b that lie in bit positions 26–31 and 58–63. Zero bits are shifted in to the most significant position.

Shift amounts from 32 to 63 give a zero result.

Figure 207. Vector shift right word unsigned (\_\_ev\_srwu)

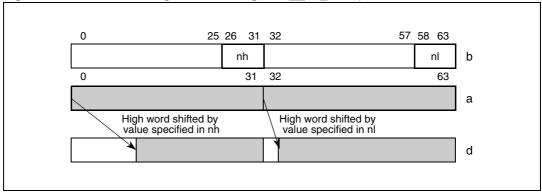

Table 214. \_\_ev\_srwu (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evsrwu d,a,b

PM0045 \_\_ev\_stdd

## \_\_ev\_stdd

Vector Store Double of Double

```
\label{eq:def_def} \begin{split} \mathbf{d} &= \underline{\quad} \mathbf{ev\_stdd} \ (\mathbf{a}, \mathbf{b}, \mathbf{c}) \\ \text{if } (\mathbf{a} = \mathbf{0}) \ \text{then temp} &\leftarrow \mathbf{0} \\ \text{else temp} &\leftarrow (\mathbf{a}) \\ \text{EA} &\leftarrow \text{temp} + \text{EXTZ} (\text{UIMM*8}) \\ \text{MEM} \ (\text{EA}, \mathbf{8}) &\leftarrow \text{RS}_{0:63} \end{split}
```

The contents of rS are stored as a double word in storage addressed by EA.

Figure 208 shows how bytes are stored in memory as determined by the endian mode.

Figure 208. \_\_ev\_stdd results in big- and little-endian modes

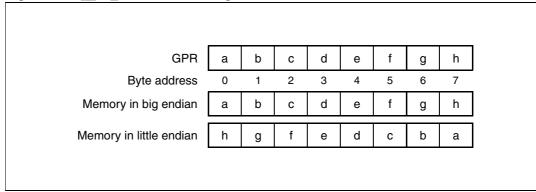

Table 215. \_\_ev\_stdd (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	ev64_opaque	5-bit unsigned	evstdd d,a,b,c

\_\_ev\_stddx PM0045

## \_\_ev\_stddx

Vector Store Double of Double Indexed

```
d = \underline{\text{ev\_stddx (a,b,c)}}
if (a = 0) then temp \leftarrow 0
else temp \leftarrow (a)
EA \leftarrow \text{temp + (b)}
MEM(EA,8) \leftarrow RS_{0:63}
```

The contents of rS are stored as a double word in storage addressed by EA.

Figure 209 shows how bytes are stored in memory as determined by the endian mode.

Figure 209. \_\_ev\_stdd[x] results in Big- and Little-Endian modes

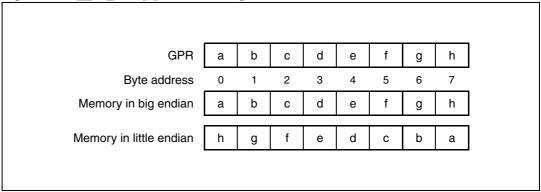

Table 216. \_\_ev\_stddx (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	ev64_opaque	int32_t	evstddx d,a,b,c

PM0045 \_\_ev\_stdh

# \_ev\_stdh

Vector Store Double of Four Half Words

```
\begin{array}{l} {\bf d = \_ev\_stdh \, (a,b,c)} \\ {\it if \, (a = 0) \, then \, temp \, \leftarrow 0} \\ {\it else \, temp \, \leftarrow a} \\ {\it EA \, \leftarrow temp \, + \, EXTZ \, (C*8)} \\ {\it MEM \, (EA,2) \, \leftarrow RS_{0:15}} \\ {\it MEM \, (EA+2,2) \, \leftarrow RS_{16:31}} \\ {\it MEM \, (EA+4,2) \, \leftarrow RS_{32:47}} \\ {\it MEM \, (EA+6,2) \, \leftarrow RS_{48:63}} \end{array}
```

The contents of **r**S are stored as four half words in storage addressed by EA.

Figure 210 shows how bytes are stored in memory as determined by the endian mode.

Figure 210. \_\_ev\_stdh results in Big- and Little-Endian modes

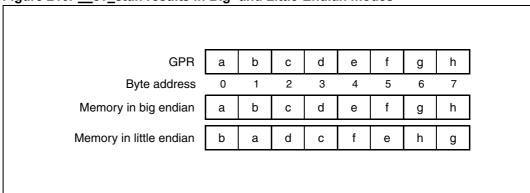

Table 217. \_\_ev\_stdh (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	ev64_opaque	5-bit unsigned	evstdh d,a,b,c

\_\_ev\_stdhx PM0045

# \_\_ev\_stdhx

Vector Store Double of Four Half Words Indexed

```
\begin{array}{l} \textbf{d = \_ev\_stdhx (a,b,c)} \\ \textbf{if (a = 0) then temp} \leftarrow \textbf{0} \\ \textbf{else temp} \leftarrow \textbf{(a)} \\ \textbf{EA} \leftarrow \textbf{temp + (b)} \\ \textbf{MEM (EA,2)} \leftarrow \textbf{RS}_{0:15} \\ \textbf{MEM (EA+2,2)} \leftarrow \textbf{RS}_{16:31} \\ \textbf{MEM (EA+4,2)} \leftarrow \textbf{RS}_{32:47} \\ \textbf{MEM (EA+6,2)} \leftarrow \textbf{RS}_{48:63} \end{array}
```

The contents of **r**S are stored as four half words in storage addressed by EA.

Figure 211 shows how bytes are stored in memory as determined by the endian mode.

Figure 211. \_\_ev\_stdhx results in Big- and Little-Endian modes

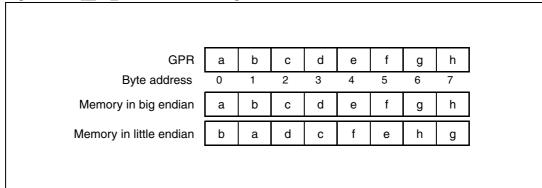

Table 218. \_\_ev\_stdhx (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	ev64_opaque	int32_t	evstdhx d,a,b,c

PM0045 \_\_ev\_stdw

## \_\_ev\_stdw

Vector Store Double of Two Words

```
d = \_ev\_stdw (a,b,c)
if (a = 0) then temp \leftarrow 0
else temp \leftarrow (a)
EA \leftarrow temp + EXTZ (UIMM*8)
MEM (EA,4) \leftarrow RS_{0:31}
MEM (EA+4,4) \leftarrow RS_{32:63}
```

The contents of rS are stored as two words in storage addressed by EA.

Figure 212 shows how bytes are stored in memory as determined by the endian mode.

Figure 212. \_\_ev\_stdw results in Big- and Little-Endian modes

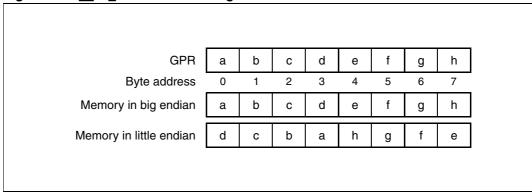

Table 219. \_\_ev\_stdw (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	ev64_opaque	5-bit unsigned	evstdw d,a,b,c

\_\_ev\_stdwx PM0045

# \_\_ev\_stdwx

Vector Store Double of Two Words Indexed

```
d = \underline{\quad ev\_stdwx (a,b,c)}
if (a = 0) then temp \leftarrow 0
else temp \leftarrow (a)
EA \leftarrow temp + (b)
MEM(EA,4) \leftarrow RS_{0:31}
MEM(EA+4,4) \leftarrow RS_{32:63}
```

The contents of **r**S are stored as two words in storage addressed by EA.

Figure 213 shows how bytes are stored in memory as determined by the endian mode.

Figure 213. \_\_ev\_stdwx results in Big- and Little-Endian modes

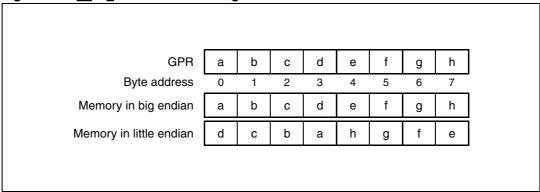

Table 220. \_\_ev\_stdwx (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	ev64_opaque	int32_t	evstdwx d,a,b,c

PM0045 \_\_ev\_stwhe

## \_ev\_stwhe

Vector Store Word of Two Half Words from Even

```
d = \_ev\_stwhe (a,b,c)
if (a = 0) then temp \leftarrow 0
else temp \leftarrow (a)
EA \leftarrow temp + EXTZ (UIMM*4)
MEM (EA,2) \leftarrow RS_{0:15}
MEM (EA+2,2) \leftarrow RS_{32:47}
```

The even half words from each element of  ${\bf r}{\bf S}$  are stored as two half words in storage addressed by EA.

Figure 214 shows how bytes are stored in memory as determined by the endian mode.

Figure 214. \_\_ev\_stwhe results in Big- and Little-Endian modes

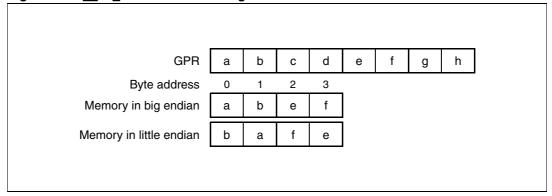

Table 221. \_\_ev\_stwhe (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	uint32_t	5-bit unsigned	evstdwhe d,a,b

\_\_ev\_stwhex PM0045

# \_ev\_stwhex

Vector Store Word of Two Half Words from Even Indexed

```
\label{eq:def_def} \begin{split} \mathbf{d} &= \underline{\quad} \mathbf{ev\_stwhex} \ (\mathbf{a}, \mathbf{b}, \mathbf{c}) \\ \text{if} \ (\mathbf{a} = \mathbf{0}) \ \text{then} \ \text{temp} \leftarrow \mathbf{0} \\ \text{else temp} &\leftarrow (\mathbf{a}) \\ \text{EA} &\leftarrow \text{temp} + (\mathbf{b}) \\ \text{MEM} \ (\mathbf{EA}, \mathbf{2}) &\leftarrow \mathbf{RS}_{0:15} \\ \text{MEM} \ (\mathbf{EA} + \mathbf{2}, \mathbf{2}) &\leftarrow \mathbf{RS}_{32:47} \end{split}
```

The even half words from each element of **r**S are stored as two half words in storage addressed by EA.

Figure 215 shows how bytes are stored in memory as determined by the endian mode.

Figure 215. \_\_ev\_stwhex results in Big- and Little-Endian modes

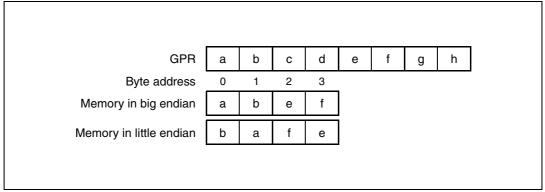

Table 222. \_\_ev\_stwhex (registers altered by).

\_\_ev\_stwwox PM0045

## \_\_ev\_stwwox

Vector Store Word of Word from Odd Indexed

```
d = \underline{\quad ev\_stwwox(a,b,c)}
if (a = 0) then temp \leftarrow 0
else temp \leftarrow (a)
EA \leftarrow temp + (b)
MEM(EA,4) \leftarrow rS_{32:63}
```

The odd word of **r**S is stored in storage addressed by EA.

Figure 221 shows how bytes are stored in memory as determined by the endian mode.

Figure 221. \_\_ev\_stwwox results in Big- and Little-Endian modes

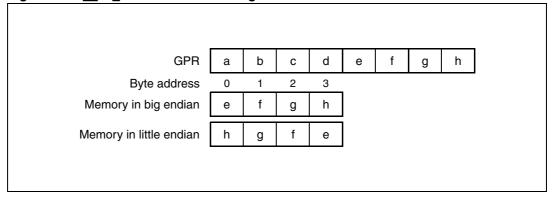

Table 228. \_\_ev\_stwwox (registers altered by).

d	а	b	С	Maps to
void	ev64_opaque	uint32_t	int32_t	evstwwox d,a,b,c

PM0045 \_\_ev\_subfsmiaaw

# \_ev\_subfsmiaaw

Vector Subtract Signed, Modulo, Integer to Accumulator Word

```
\begin{array}{l} \textbf{d = \_ev\_subfsmiaaw(a)} \\ // \  \, \textbf{high} \\ \textbf{d}_{0:31} \leftarrow \textbf{ACC}_{0:31} - \textbf{a}_{0:31} \\ // \  \, \textbf{low} \\ \textbf{d}_{32:63} \leftarrow \textbf{ACC}_{32:63} - \textbf{a}_{32:63} \\ // \  \, \textbf{update accumulator} \\ \textbf{ACC}_{0:63} \leftarrow \textbf{d}_{0:63} \end{array}
```

Each word element in parameter a is subtracted from the corresponding element in the accumulator and the difference is placed into the corresponding parameter d word and into the accumulator.

Other registers altered: ACC

Figure 222. Vector subtract signed, modulo, integer to accumulator Word (\_\_ev\_subfsmiaaw)

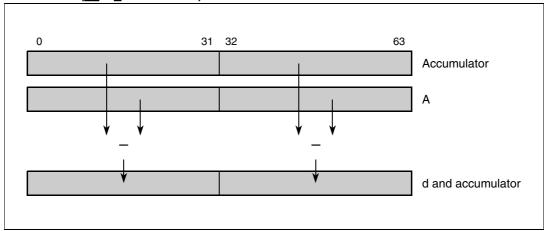

Table 229. \_\_ev\_subfsmiaaw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evsubfsmiaaw d,a

ev subfssiaaw PM0045

## \_ev\_subfssiaaw

Vector Subtract Signed, Saturate, Integer to Accumulator Word

```
 \begin{aligned} & \textbf{d} = \_\texttt{ev\_subfssiaaw(a)} \\ & // \text{ high} \\ & \texttt{temp}_{0:63} \leftarrow \texttt{EXTS}(\texttt{ACC}_{0:31}) - \texttt{EXTS}(\texttt{a}_{0:31}) \\ & \texttt{ovh} \leftarrow \texttt{temp}_{31} \oplus \texttt{temp}_{32} \\ & \texttt{d}_{0:31} \leftarrow \texttt{SATURATE}(\texttt{ovh}, \texttt{temp}_{31}, \texttt{0x80000000}, \texttt{0x7fffffff}, \texttt{temp}_{32:63}) \\ & // \texttt{low} \\ & \texttt{temp}_{0:63} \leftarrow \texttt{EXTS}(\texttt{ACC}_{32:63}) - \texttt{EXTS}(\texttt{a}_{32:63}) \\ & \texttt{ovl} \leftarrow \texttt{temp}_{31} \oplus \texttt{temp}_{32} \\ & \texttt{d}_{32:63} \leftarrow \texttt{SATURATE}(\texttt{ovl}, \texttt{temp}_{31}, \texttt{0x80000000}, \texttt{0x7fffffff}, \texttt{temp}_{32:63}) \\ & // \texttt{update} \texttt{accumulator} \\ & \texttt{ACC}_{0:63} \leftarrow \texttt{d}_{0:63} \\ & \texttt{SPEFSCR}_{\texttt{OVH}} \leftarrow \texttt{ovh} \\ & \texttt{SPEFSCR}_{\texttt{OVH}} \leftarrow \texttt{ovl} \\ & \texttt{SPEFSCR}_{\texttt{SOVH}} \leftarrow \texttt{SPEFSCR}_{\texttt{SOVH}} \mid \texttt{ovh} \\ & \texttt{SPEFSCR}_{\texttt{SOV}} \leftarrow \texttt{SPEFSCR}_{\texttt{SOV}} \mid \texttt{ovl} \end{aligned}
```

Each signed integer word element in parameter a is sign-extended and subtracted from the corresponding sign-extended element in the accumulator, saturating if overflow occurs, and the results are placed in parameter d and the accumulator. Any overflow is recorded in the SPEFSCR overflow and summary overflow bits.

Other registers altered: SPEFSCR ACC

Figure 223. Vector subtract signed, saturate, integer to accumulator Word (\_\_ev\_subfssiaaw)

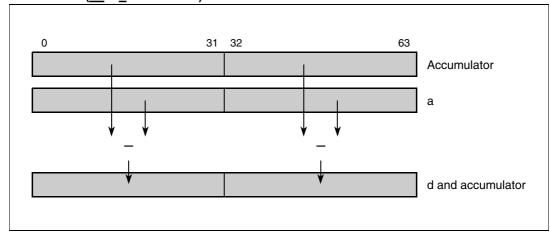

Table 230. \_\_ev\_subfssiaaw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evsubfssiaaw d,a

PM0045 \_\_ev\_subfumiaaw

# \_ev\_subfumiaaw

Vector Subtract Unsigned, Modulo, Integer to Accumulator Word

```
 \begin{aligned} & d = \_ev\_subfumiaaw(a) \\ & // \ high \\ & d_{0:31} \leftarrow ACC_{0:31} - a_{0:31} \\ & // \ low \\ & d_{32:63} \leftarrow ACC_{32:63} - a_{32:63} \\ & // \ update \ accumulator \\ & ACC_{0:63} \leftarrow d_{0:63} \end{aligned}
```

Each unsigned integer word element in parameter a is subtracted from the corresponding element in the accumulator, and the results are placed in the corresponding parameter d and into the accumulator.

Other registers altered: ACC

Figure 224. Vector subtract unsigned, modulo, integer to accumulator Word (\_\_ev\_subfumiaaw)

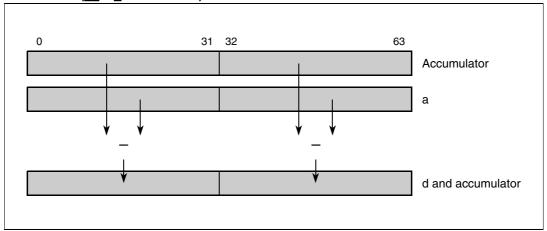

Table 231. \_\_ev\_subfumiaaw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evsubfumiaaw d,a

ev subfusiaaw PM0045

## \_ev\_subfusiaaw

Vector Subtract Unsigned, Saturate, Integer to Accumulator Word

```
 \begin{aligned} & \textbf{d} = \_\texttt{ev\_subfusiaaw(a)} \\ & // \text{ high} \\ & \texttt{temp}_{0:63} \leftarrow \texttt{EXTZ}(\texttt{ACC}_{0:31}) - \texttt{EXTZ}(\texttt{a}_{0:31}) \\ & \texttt{ovh} \leftarrow \texttt{temp}_{31} \\ & \texttt{d}_{0:31} \leftarrow \texttt{SATURATE}(\texttt{ovh, temp}_{31}, \texttt{0x000000000}, \texttt{0x000000000}, \texttt{temp}_{32:63}) \\ & // \texttt{low} \\ & \texttt{temp}_{0:63} \leftarrow \texttt{EXTS}(\texttt{ACC}_{32:63}) - \texttt{EXTS}(\texttt{a}_{32:63}) \\ & \texttt{ovl} \leftarrow \texttt{temp}_{31} \\ & \texttt{d}_{32:63} \leftarrow \texttt{SATURATE}(\texttt{ovl, temp}_{31}, \texttt{0x000000000}, \texttt{0x00000000}, \texttt{temp}_{32:63}) \\ & // \texttt{update accumulator} \\ & \texttt{ACC}_{0:63} \leftarrow \texttt{d}_{0:63} \\ & \texttt{SPEFSCR}_{\text{OVH}} \leftarrow \texttt{ovh} \\ & \texttt{SPEFSCR}_{\text{SOVH}} \leftarrow \texttt{SPEFSCR}_{\text{SOVH}} \mid \texttt{ovh} \\ & \texttt{SPEFSCR}_{\text{SOVH}} \leftarrow \texttt{SPEFSCR}_{\text{SOV}} \mid \texttt{ovh} \end{aligned}
```

Each unsigned integer word element in parameter a is zero-extended and subtracted from the corresponding zero-extended element in the accumulator, saturating if underflow occurs, and the results are placed in parameter d and the accumulator. Any underflow is recorded in the SPEFSCR overflow and summary overflow bits.

Other registers altered: SPEFSCR ACC

Figure 225. Vector subtract unsigned, saturate, integer to accumulator Word (\_\_ev\_subfusiaaw)

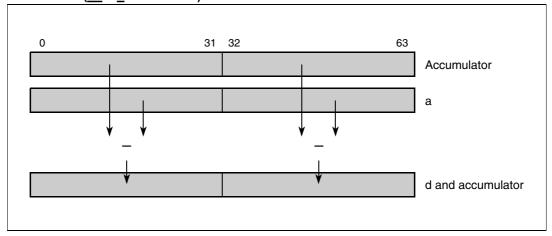

Table 232. \_\_ev\_subfusiaaw (registers altered by).

d	а	Maps to
ev64_opaque	ev64_opaque	evsubfusiaaw d,a

PM0045 \_\_ev\_subfw

# \_\_ev\_subfw

Vector Subtract from Word

```
d = \underline{\quad} ev_subfw(a,b)
```

```
\texttt{d}_{\text{0:31}} \leftarrow \texttt{b}_{\text{0:31}} - \texttt{a}_{\text{0:31}} // Modulo difference \texttt{d}_{\text{32:63}} \leftarrow \texttt{b}_{\text{32:63}} - \texttt{a}_{\text{32:63}} // Modulo difference
```

Each signed integer element of parameter a is subtracted from the corresponding element of parameter b, and the results are placed into parameter d.

Figure 226. Vector subtract from word (\_\_ev\_subfw)

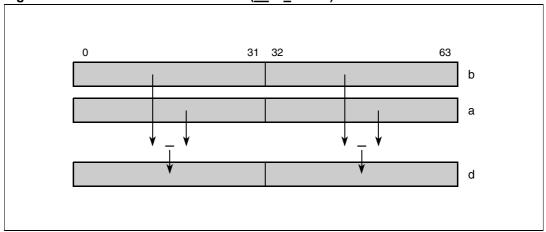

Table 233. \_\_ev\_subfw (registers altered by).

d	а	b	Maps to
ev64_opaque	ev64_opaque	ev64_opaque	evsubfw d,a,b

\_\_ev\_subifw PM0045

# \_\_ev\_subifw

Vector Subtract Immediate from Word

#### $d = \underline{\quad} ev_subifw(a,b)$

```
\begin{array}{l} d_{0:31} \leftarrow b_{0:31} \text{ - EXTZ(UIMM) // Modulo difference} \\ d_{32:63} \leftarrow b_{32:63} \text{ - EXTZ(UIMM)// Modulo difference} \end{array}
```

UIMM is zero-extended and subtracted from both the high and low elements of parameter b. Note that the same value is subtracted from both elements of the register. UIMM is 5 bits.

Figure 227. Vector subtract immediate from word (\_\_ev\_subifw)

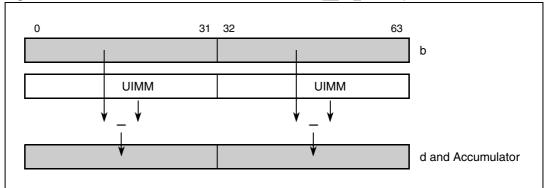

Table 234. \_\_ev\_subifw (registers altered by).

d	а	b	Maps to
ev64_opaque	5-bit unsigned	ev64_opaque	evsubifw d,a,b

PM0045 \_\_ev\_upper\_eq

#### \_\_ev\_upper\_eq

Vector Upper Bits Equal

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_upper\_eq(a,b)} \\ &\texttt{if} \ (\textbf{a}_{0:31} = \textbf{b}_{0:31}) \ \texttt{then} \ \textbf{d} \leftarrow \texttt{true} \\ &\texttt{else} \ \textbf{d} \leftarrow \texttt{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are equal to the upper 32 bits of parameter b.

Figure 228. Vector upper Equal(\_\_ev\_upper\_eq)

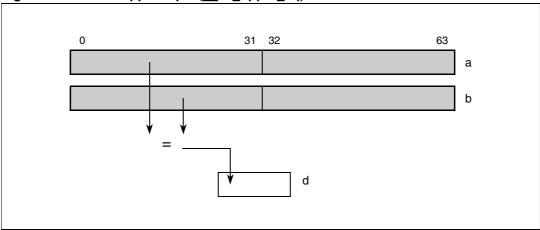

Table 235. \_\_ev\_upper\_eq (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmpeq x,a,b

\_\_ev\_upper\_fs\_eq PM0045

# \_ev\_upper\_fs\_eq

Vector Upper Bits Floating-Point Equal

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_upper\_fs\_eq(a,b)} \\ &\texttt{if} \ (\textbf{a}_{0:31} = \textbf{b}_{0:31}) \ \texttt{then} \ \textbf{d} \leftarrow \texttt{true} \\ &\texttt{else} \ \textbf{d} \leftarrow \texttt{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are equal to the upper 32 bits of parameter b.

Figure 229. Vector upper Floating-Point Equal(\_\_ev\_upper\_fs\_eq)

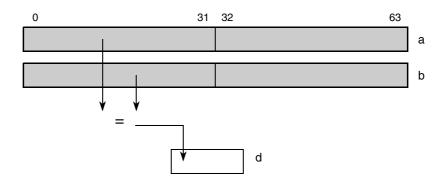

Table 236. \_\_ev\_upper\_fs\_eq (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfscmpeq x,a,b

274/315 Doc ID 13881 Rev 3

PM0045 \_\_ev\_upper\_fs\_gt

# \_\_ev\_upper\_fs\_gt

Vector Upper Bits Floating-Point Greater Than

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_upper\_fs\_gt(a,b)} \\ &\texttt{if } (\textbf{a}_{0:31} > \textbf{b}_{0:31}) \texttt{ then } \textbf{d} \leftarrow \texttt{true} \\ &\texttt{else } \textbf{d} \leftarrow \texttt{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are greater than the upper 32 bits of parameter b.

Figure 230. Vector upper Floating-Point greater than (\_\_ev\_upper\_fs\_gt)

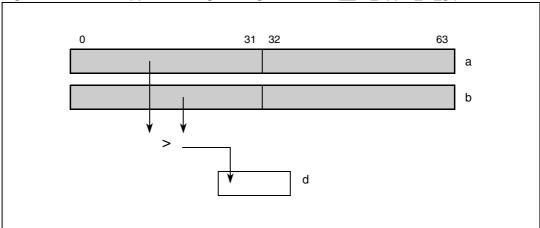

Table 237. \_\_ev\_upper\_fs\_gt (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfscmpgt x,a,b

\_\_ev\_upper\_fs\_lt PM0045

# \_ev\_upper\_fs\_lt

Vector Upper Bits Floating-Point Less Than

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_upper\_fs\_lt(a,b)} \\ &\texttt{if} \ (\textbf{a}_{0:31} \ < \ \textbf{b}_{0:31}) \ \texttt{then} \ \textbf{d} \leftarrow \texttt{true} \\ &\texttt{else} \ \textbf{d} \ \leftarrow \texttt{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are less than the upper 32 bits of parameter b.

Figure 231. Vector upper Floating-Point less than (\_\_ev\_upper\_fs\_lt)

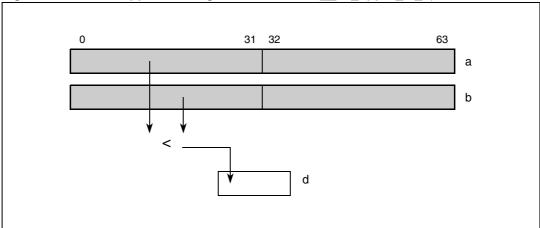

Table 238. \_\_ev\_upper\_fs\_lt (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evfscmplt x,a,b

# \_\_ev\_upper\_fs\_tst\_eq

Vector Upper Bits Floating-Point Test Equal

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_upper\_fs\_tst\_eq(a,b)} \\ &\texttt{if} \ (\textbf{a}_{0:31} = \textbf{b}_{0:31}) \ \texttt{then} \ \textbf{d} \leftarrow \texttt{true} \\ &\texttt{else} \ \textbf{d} \leftarrow \texttt{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are equal to the upper 32 bits of parameter b. This intrinsic differs from \_\_ev\_upper\_fs\_eq because no exceptions are taken during its execution. If strict IEEE 754 compliance is required, use \_\_ev\_upper\_fs\_eq instead.

Figure 232. Vector upper Floating-Point test equal (\_\_ev\_upper\_fs\_tst\_eq)

PM0045 \_\_ev\_upper\_gtu

#### \_\_ev\_upper\_gtu

Vector Upper Bits Greater Than Unsigned

```
\label{eq:def_def} \begin{split} \textbf{d} &= \_\texttt{ev\_upper\_gtu(a,b)} \\ &\texttt{if } (a_{0:31} > _{\texttt{unsigned}} \ b_{0:31}) \ \texttt{then } d \leftarrow \texttt{true} \\ &\texttt{else } d \leftarrow \texttt{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are greater than the upper 32 bits of parameter b.

Figure 236. Vector upper greater than unsigned (\_\_ev\_upper\_gtu)

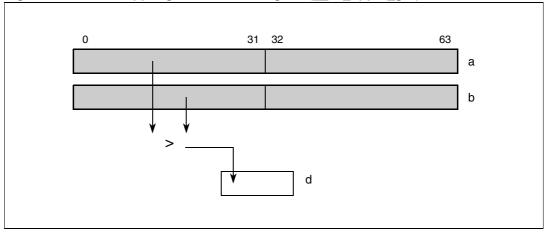

Table 243. \_\_ev\_upper\_gtu (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmpgtu x,a,b

\_\_ev\_upper\_lts PM0045

# \_ev\_upper\_lts

Vector Upper Bits Less Than Signed

```
\label{eq:decomposition} \begin{split} \textbf{d} &= \underline{\quad} \textbf{ev\_upper\_lts(a,b)} \\ &\text{if } (\textbf{a}_{0:31} <_{\text{signed}} \textbf{b}_{0:31}) \text{ then } \textbf{d} \leftarrow \text{true} \\ &\text{else } \textbf{d} \leftarrow \text{false} \end{split}
```

This intrinsic returns true if the upper 32 bits of parameter a are less than the upper 32 bits of parameter b.

Figure 237. Vector upper less than signed (\_\_ev\_upper\_lts)

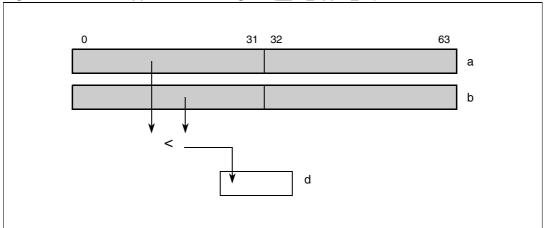

Table 244. \_\_ev\_upper\_lts (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmplts x,a,b

PM0045 \_\_ev\_upper\_ltu

# \_\_ev\_upper\_ltu

```
Vector Upper Bits Less Than Unsigned  \label{eq:def} \begin{array}{l} d = \underbrace{\quad ev\_upper\_ltu(a,b)}_{\text{if } (a_{0:31} <_{unsigned} b_{0:31}) \text{ then } d \leftarrow \text{true} \\ \text{else } d \leftarrow \text{false} \end{array}
```

This intrinsic returns true if the upper 32 bits of parameter a are less than the upper 32 bits of parameter b.

Figure 238. Vector upper less than unsigned (\_\_ev\_upper\_ltu)

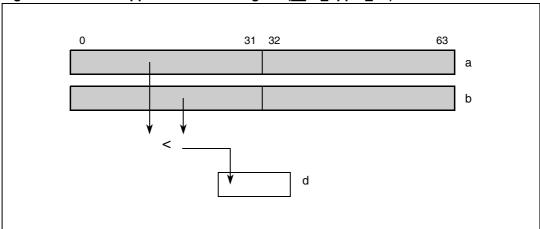

Table 245. \_\_ev\_upper\_ltu (registers altered by).

d	а	b	Maps to
_Bool	ev64_opaque	ev64_opaque	evcmpltu x,a,b

\_\_ev\_xor PM0045

#### \_\_ev\_xor

Vector XOR

# $\begin{array}{l} \textbf{d = \_ev\_xor (a,b)} \\ \textbf{d}_{0:31} \leftarrow \textbf{a}_{0:31} \ \oplus \ \textbf{b}_{0:31} \ // \ \textbf{Bitwise XOR} \\ \textbf{d}_{32:63} \leftarrow \textbf{a}_{32:63} \ \oplus \ \textbf{b}_{32:63} // \ \textbf{Bitwise XOR} \end{array}$

Each element of parameters a and b is exclusive-ORed. The results are placed in parameter d.

Figure 239. Vector XOR (\_\_ev\_xor)

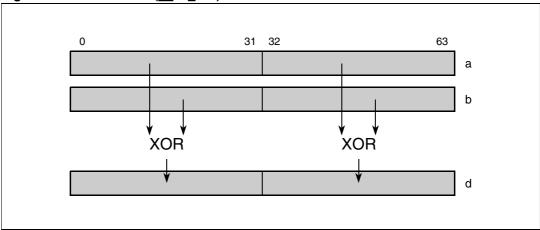

Table 246. \_\_ev\_xor (registers altered by).

d	а	b	Maps to

# LOAD/STORE
```

Note:

The 5-bit unsigned literal in the immediate form is scaled by the size of the load or store to determine how many bytes the pointer 'p' is offset by. The size of the load is determined by the first letter after the 'l': 'd'—double-word (8 bytes), 'w'—word (4 bytes), 'h'—half word (2 bytes). For details, see Chapter 5".

# creation/insertion/extraction

## 4 Additional operations

## 4.1 Data manipulation

The intrinsics in section one act like functions with parameters that are passed by value. *Figure 240* and *Figure 241* show the layout of a \_\_ev64\_opaque\_\_ variable in the register with reference to creation, insertion, and extraction routines (regardless of endianess).

Figure 241 shows byte, half-word, and word ordering.

Figure 240. Big-endian word ordering

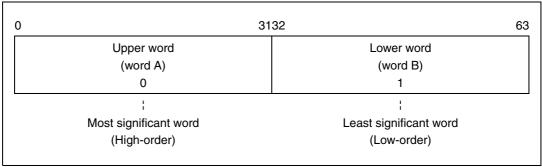

Figure 241. Big-endian half-word ordering

```
1516
High-order half-word
                        Low-order half-word
                                                High-order half-word
                                                                         Low-order half-word
                             for word 0
     for word 0
                                                      for word 1
                                                                              for word 1

                             Half-word B
                                                     Half-word C
                                                                             Half-word D
         0
                                                                                  3
Most significant half-
                                                                        Least significant half-
                                                                                 word
       word
                                                                             (Low-order)
    (High-order)
```

#### 4.1.1 Creation intrinsics

These intrinsics create new generic 64-bit opaque data types from the given inputs passed by value. More specifically, they are created from the following inputs: 1 signed or unsigned 64-bit integer, 2 single-precision floats, 2 signed or unsigned 32-bit integers, or 4 signed or unsigned 16-bit integers.

```
__ev64_opaque__ __ev_create_u64( uint64_t a );
__ev64_opaque_ __ev_create_s64( int64_t a );
__ev64_opaque_ __ev_create_fs( float a, float b );
__ev64_opaque_ __ev_create_u32( uint32_t a, uint32_t b );
__ev64_opaque_ __ev_create_s32( int32_t a, int32_t b );
__ev64_opaque_ __ev_create_u16( uint16_t a, uint16_t b, uint16_t c, uint16_t d );
__ev64_opaque_ __ev_create_s16( int16_t a, int16_t b, int16_t c, int16_t d );
__ev64_opaque_ __ev_create_sfix32_fs( float a, float b );
__ev64_opaque_ __ev_create_ufix32_fs( float a, float b );
```

```
//maps to__ev_create_u32
__ev64_opaque__ __ev_create_ufix32_u32( uint32_t a, uint32_t b );

// maps to __ev_create_s32
__ev64_opaque__ __ev_create_sfix32_s32( int32_t a, int32_t b );
```

#### 4.1.2 Convert intrinsics

These intrinsics convert a generic 64-bit opaque data type to a specific signed or unsigned integral form.

```
uint64_t __ev_convert_u64( __ev64_opaque__ a );
int64_t __ev_convert_s64( __ev64_opaque__ a );
```

#### 4.1.3 Get intrinsics

These intrinsics allow the user to access data from within a specified location of the generic 64-bit opaque data type.

## Get\_upper/lower

These intrinsics specify whether the upper 32-bits or lower 32-bits of the 64-bit opaque data type are returned. Only signed/unsigned 32-bit integers or single-precision floats are returned.

```
uint32_t __ev_get_upper_u32( __ev64_opaque__ a );
uint32_t __ev_get_lower_u32( __ev64_opaque__ a );
int32_t __ev_get_upper_s32( __ev64_opaque__ a );
int32_t __ev_get_lower_s32( __ev64_opaque __ a );
float __ev_get_upper_fs( __ev64_opaque__ a );
float __ev_get_lower_fs( __ev64_opaque__ a );
// maps to __ev_get_upper_u32
uint32_t __ev_get_upper_ufix32_u32( __ev64_opaque__ a );
// maps to __ev_get_lower_u32
uint32_t __ev_get_lower_ufix32_u32( __ev64_opaque__ a );
// maps to __ev_get_upper_s32
int32_t __ev_get_upper_sfix32_s32( __ev64_opaque__ a );
// maps to __ev_get_lower s32
int32_t __ev_get_lower_sfix32_s32( __ev64_opaque__ a );
// equivalent to __ev_get_sfix32_fs(a, 0);
float __ev_get_upper_sfix32_fs( __ev64_opaque__ a );
// equivalent to __ev_get_sfix32_fs(a, 1);
float __ev_get_lower_sfix32_fs( __ev64_opaque__ a );
// equivalent to __ev_get_ufix32_fs(a, 0);
float __ev_get_upper_ufix32_fs( __ev64_opaque__ a );
```

```
// equivalent to __ev_get_ufix32_fs(a, 1);
float __ev_get_lower_ufix32_fs( __ev64_opaque__ a );
```

#### Get explicit position

These intrinsics allow the user to specify the position (pos) in the 64-bit opaque data type where the data is accessed and returned. The position is 0 or 1 for words and either 0, 1, 2, or 3 for half-words.

```
uint32_t __ev_get_u32( __ev64_opaque__ a, uint32_t pos );
int32_t __ev_get_s32( __ev64_opaque__ a, uint32_t pos );
float __ev_get_fs( __ev64_opaque__ a, uint32_t pos );
uint16_t __ev_get_u16( __ev64_opaque__ a, uint32_t pos );
int16_t __ev_get_s16( __ev64_opaque__ a, uint32_t pos );

// maps to __ev_get_u32
uint32_t __ev_get_ufix32_u32( __ev64_opaque__ a, uint32_t pos );

// maps to __ev_get_s32
int32_t __ev_get_sfix32_s32( __ev64_opaque__ a, uint32_t pos );

float __ev_get_ufix32_fs( __ev64_opaque__ a, uint32_t pos );
float __ev_get_sfix32_fs( __ev64_opaque__ a, uint32_t pos );
```

#### 4.1.4 Set intrinsics

These intrinsics provide the capability of setting values in a 64-bit opaque data type that the intrinsic or the user specifies.

## Set\_upper/lower

These intrinsics specify which word (either upper or lower 32-bits) of the 64-bit opaque data type is set to input value b.

Additional operations PM0045

```
// equivalent to __ev_set_sfix32_fs(a, b, 1);
__ev64_opaque__ __ev_set_lower_sfix32_fs( __ev64_opaque__ a, float b );

// equivalent to __ev_set_ufix32_fs(a, b, 0);
__ev64_opaque__ __ev_set_upper_ufix32_fs( __ev64_opaque__ a, float b );

// equivalent to __ev_set_ufix32_fs(a, b, 1);
__ev64_opaque__ __ev_set_lower_ufix32_fs( __ev64_opaque__ a, float b );
```

#### Set accumulator

These intrinsics initialize the accumulator to the input value a.

```
__ev64_opaque_ __ev_set_acc_u64( uint64_t a );
__ev64_opaque_ __ev_set_acc_s64( int64_t a );
__ev64_opaque_ __ev_set_acc_vec64( __ev64_opaque__ a );
```

#### Set explicit position

These intrinsics set the 64-bit opaque input value a to the value in b based on the position given in pos. Unlike the intrinsics in 4.1.4.1, the positional value is specified by the user to be either 0 or 1 for words or 0, 1, 2, or 3 for half-words.

```
__ev64_opaque__ __ev_set_u32( __ev64_opaque__ a, uint32_t b, uint32_t pos );
__ev64_opaque_ __ev_set_s32( __ev64_opaque__ a, int32_t b, uint32_t pos );
__ev64_opaque_ __ev_set_fs( __ev64_opaque__ a, float b, uint32_t pos );
__ev64_opaque_ __ev_set_u16( __ev64_opaque__ a, uint16_t b, uint32_t pos );
__ev64_opaque_ __ev_set_s16( __ev64_opaque__ a, int16_t b, uint32_t pos );

// maps to __ev_set_u32
__ev64_opaque_ __ev_set_ufix32_u32( __ev64_opaque__ a, uint32_t b, uint32_t pos);

// maps to __ev_set_s32
__ev64_opaque_ __ev_set_sfix32_s32( __ev64_opaque__ a, int32_t b, uint32_t pos);

__ev64_opaque_ __ev_set_ufix32_fs( __ev64_opaque__ a, float b, uint32_t pos );
__ev64_opaque_ __ev_set_sfix32_fs( __ev64_opaque__ a, float b, uint32_t pos );
__ev64_opaque_ __ev_set_sfix32_fs( __ev64_opaque__ a, float b, uint32_t pos );
```

# 4.2 Signal processing engine (SPE) APU registers

The SPE includes the following two registers:

- The signal processing and embedded floating-point status and control register (SPEFSCR), described in Chapter 4.2.1: Signal processing and embedded floating-point status and control register (SPEFSCR) on page 298."
- A 64-bit accumulator, described in Chapter 3.1.2: Accumulator (ACC) on page 21."

# 4.2.1 Signal processing and embedded floating-point status and control register (SPEFSCR)

The SPEFSCR, which is shown in *Figure 242*, is used for status and control of SPE instructions.

Figure 242. Signal processing and embedded floating-point status and control register (SPEFSCR)

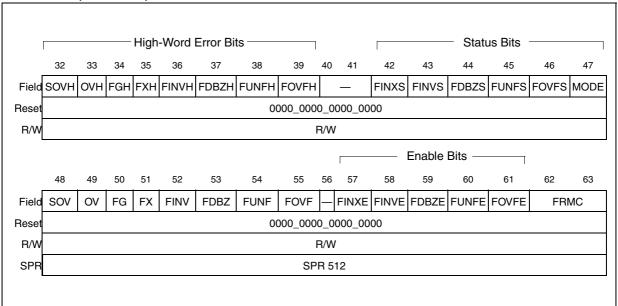

Table 247. SPEFSCR field descriptions

Bits	Name	Function
32	SOVH	Summary integer overflow high. Set whenever an instruction (except <b>mtspr</b> ) sets OVH. SOVH remains set until it is cleared by an <b>mtspr[SPEFSCR]</b> .
33	OVH	Integer overflow high. An overflow occurred in the upper half of the register while executing a SPE integer instruction.
34	FGH	Embedded floating-point guard bit high. Floating-point guard bit from the upper half. The value is undefined if the processor takes a floating-point exception due to input error, floating-point overflow, or floating-point underflow.
35	FXH	Embedded floating-point sticky bit high. Floating bit from the upper half. The value is undefined if the processor takes a floating-point exception due to input error, floating-point overflow, or floating-point underflow.
36	FINVH	Embedded floating-point invalid operation error high. Set when an input value on the high side is a NaN, Inf, or Denorm. Also set on a divide if both the dividend and divisor are zero.
37	FDBZH	Embedded floating-point divide by zero error high. Set if the dividend is non-zero and the divisor is zero.
38	FUNFH	Embedded floating-point underflow error high
39	FOVFH	Embedded floating-point overflow error high
40–41	_	Reserved, and should be cleared
42	FINXS	Embedded floating-point inexact sticky. FINXS = FINXS   FGH   FXH   FG   FX.
43	FINVS	Embedded floating-point invalid operation sticky. Location for software to use when implementing true IEEE floating point.
44	FDBZS	Embedded floating-point divide by zero sticky. FDBZS = FDBZS   FDBZH   FDBZ.
45	FUNFS	Embedded floating-point underflow sticky. Storage location for software to use when implementing true IEEE floating point.

577

Table 247. SPEFSCR field descriptions (continued)

Bits	Name	Function		
46	FOVFS	Embedded floating-point overflow sticky. Storage location for software to use when implementing true IEEE floating point.		
47	MODE	Embedded floating-point mode (read-only on e500)		
48	SOV	Integer summary overflow. Set whenever an SPE instruction (except <b>mtspr</b> ) sets OV. SOV remains set until it is cleared by <b>mtspr[SPEFSCR]</b> .		
49	OV	Integer overflow. An overflow occurred in the lower half of the register while a SPE integer instruction was executed.		
50	FG	Embedded floating-point guard bit. Floating-point guard bit from the lower half. The value is undefined if the processor takes a floating-point exception due to input error, floating-point overflow, or floating-point underflow.		
51	FX	Embedded floating-point sticky bit. Floating bit from the lower half. The value is undefined if the processor takes a floating-point exception due to input error, floating-point overflow, or floating-point underflow.		
52	FINV	Embedded floating-point invalid operation error. Set when an input value on the high side is a NaN, Inf, or Denorm. Also set on a divide if both the dividend and divisor are zero.		
53	FDBZ	Embedded floating-point divide by zero error. Set of the dividend is non-zero and the divisor is zero.		
54	FUNF	Embedded floating-point underflow error		
55	FOVF	Embedded floating-point overflow error		
56	_	Reserved, and should be cleared		
57	FINXE	Embedded floating-point inexact enable		
58	FINVE	Embedded floating-point invalid operation/input error exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if FINV or FINVH is set by a floating-point instruction.		
59	FDBZE	Embedded floating-point divide-by-zero exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if FDBZ or FDBZH is set by a floating-point instruction.		
60	FUNFE	Embedded floating-point underflow exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if FUNF or FUNFH is set by a floating-point instruction.		

Table 247. SPEFSCR field descriptions (continued)

Bits	Name	Function	
61	FOVFE	Embedded floating-point overflow exception enable  0: Exception disabled  1: Exception enabled  If the exception is enabled, a floating-point data exception is taken if FOVF or FOVFH is set by a floating-point instruction.	
62–63	FRMC	Embedded floating-point rounding mode control  00: Round to nearest  01: Round toward zero  10: Round toward +infinity  11: Round toward -infinity	

#### 4.2.2 SPEFSCR intrinsics

The following sections discuss SPEFSCR low-level accessors and SPEFSCR clear and set functions.

#### **SPEFSCR low-level accessors**

These intrinsics allow the user to access specific bits in the status and control registers.

```
uint32_t __ev_get_spefscr_sovh( );
uint32_t __ev_get_spefscr_ovh();
uint32_t __ev_get_spefscr_fgh();
uint32_t __ev_get_spefscr_fxh();
uint32_t __ev_get_spefscr_finvh();
uint32_t __ev_get_spefscr_fdbzh();
uint32_t __ev_get_spefscr_funfh();
uint32_t __ev_get_spefscr_fovfh();
uint32_t __ev_get_spefscr_finxs();
uint32_t __ev_get_spefscr_finvs();
uint32_t __ev_get_spefscr_fdbzs();
uint32_t __ev_get_spefscr_funfs();
uint32_t __ev_get_spefscr_fovfs();
uint32_t __ev_get_spefscr_mode();
uint32_t __ev_get_spefscr_sov();
uint32_t __ev_get_spefscr_ov();
uint32_t __ev_get_spefscr_fg();
uint32_t __ev_get_spefscr_fx( );
uint32_t __ev_get_spefscr_finv();
uint32_t __ev_get_spefscr_fdbz();
uint32_t __ev_get_spefscr_funf();
uint32_t __ev_get_spefscr_fovf();
uint32_t __ev_get_spefscr_finxe();
uint32_t __ev_get_spefscr_finve();
uint32_t __ev_get_spefscr_fdbze();
uint32_t __ev_get_spefscr_funfe();
uint32_t __ev_get_spefscr_fovfe();
uint32_t __ev_get_spefscr_frmc();
SPEFSCR Clear and Set Functions
```

Note:

These intrinsics allow the user to clear and set specific bits in the status and control register. The user can set only the rounding mode bits.

```
void __ev_clr_spefscr_sovh();
void __ev_clr_spefscr_sov();

void __ev_clr_spefscr_finxs();
void __ev_clr_spefscr_finvs();
void __ev_clr_spefscr_fdbzs();
void __ev_clr_spefscr_funfs();
void __ev_clr_spefscr_fovfs();

void __ev_clr_spefscr_frmc( uint32_t rnd );

// rnd = 0 (nearest), rnd = 1 (zero),
// rnd = 2 (+inf), rnd = 3 (-inf)
```

## 4.3 Application binary interface (ABI) extensions

The following sections discuss ABI extensions.

## 4.3.1 malloc(), realloc(), calloc(), and new

The malloc(), realloc(), and calloc() functions are required to return a pointer with the proper alignment for the object in question. Therefore, to conform to the ABI, these functions must return pointers to memory locations that are at least 8-byte aligned. In the case of the C++ operator new, the implementation of new is required to use the appropriate set of functions based on the alignment requirements of the type.

## 4.3.2 printf example

The programming model specifies several new conversion format tokens. The programming model expects a combination of existing format tokens, new format tokens, and \_\_ev\_get\_\* intrinsics. *Table 248* lists new tokens specified to handle fixed-point data types.

Table 248. New tokens for fixed-point data types	<b>Table 248.</b>	New tokens	for fixed-point	data types
--	-------------------	------------	-----------------	------------

Token	Data representation
%hr	Signed 16-bit fixed point
%r	Signed 32-bit fixed point
%lr	Signed 64-bit fixed point
%hR	Unsigned 16-bit fixed point
%R	Unsigned 32-bit fixed point
%IR	Unsigned 64-bit fixed point

#### Example:

```
__ev64_opaque__ a ;

a = __ev_create_s32 ( 2, -3 );

printf ( " %d %d \n", __ev_get_upper_s32(a), __ev_get_lower_s32(a) );

// output:
// 2 -3
```

The default precision for the new tokens is 6 digits. The tokens should be treated like the %f token with respect to floating-point values. The same field width and precision options should be respected for the new tokens, as the following example shows:

```
printf ("%1r", 0x4000);==> "0.500000"
printf ("%r", 0x40000000); ==> "0.500000"
printf ("%hr", 0x40000000000000011);==> "0.500000"
printf ("%09.5r",0x40000000);==> "000.50000"
printf ("%09.5f",0.5);==> "000.50000"
```

## 4.3.3 Additional library routines

The functions atosfix16, atosfix32, atosfix64, atoufix16, atoufix32, and atoufix64 need not affect the value of the integer expression errno on an error. If the value of the result cannot be represented, the behavior is undefined.

```
#include <spe.h>
int16_t atosfix16(const char *str);
int32_t atosfix32(const char *str);
int64_t atosfix64(const char *str);
uint16_t atoufix16(const char *str);
uint32_t atoufix32(const char *str);
uint64_t atoufix64(const char *str);
```

The atosfix16, atosfix32, atosfix64, atoufix16, atoufix32, atoufix64 functions convert the initial portion of the string to which str points to the following numbers:

- 16-bit signed fixed-point number
- 32-bit signed fixed-point number
- 64-bit signed fixed-point number
- 16-bit unsigned fixed-point number
- 32-bit unsigned fixed-point number
- 64-bit unsigned fixed-point number

These numbers are represented as int16\_t, int32\_t, int64\_t, uint16\_t, uint32\_t, and uint64\_t, respectively.

Except for the behavior on error, they are equivalent to the following:

```
atosfix16: strtosfix16(str, (char **)NULL)
atosfix32: strtosfix32(str, (char **)NULL)
atosfix64: strtosfix64(str, (char **)NULL)
atoufix16: strtoufix16(str, (char **)NULL)
atoufix32: strtoufix32(str, (char **)NULL)
atoufix64: strtoufix64(str, (char **)NULL)
#include <spe.h>
int16_t strtosfix16(const char *str, char **endptr);
int32_t strtosfix32(const char *str, char **endptr);
int64_t strtoufix64(const char *str, char **endptr);
uint16_t strtoufix16(const char *str, char **endptr);
uint32_t strtoufix32(const char *str, char **endptr);
uint32_t strtoufix32(const char *str, char **endptr);
uint64_t strtoufix64(const char *str, char **endptr);
```

The strtosfix16, strtosfix32, strtosfix64, strtoufix16, strtoufix32, strtoufix64 functions convert the initial portion of the string to which str points to the following numbers:

- 16-bit signed fixed-point number
- 32-bit signed fixed-point number
- 64-bit signed fixed-point number
- 16-bit unsigned fixed-point number
- 32-bit unsigned fixed-point number
- 64-bit unsigned fixed-point number

These numbers are represented as int16\_t, int32\_t, int64\_t, uint16\_t, uint32\_t, and uint64\_t, respectively.

The functions support the same string representations for fixed-point numbers that the strtod, strtof, strtold functions support, with the exclusion of NAN and INFINITY support.

For the signed functions, if the input value is greater than or equal to 1.0, positive saturation should occur and errno should be set to ERANGE. If the input value is less than -1.0, negative saturation should occur, and errno should be set to ERANGE.

For the unsigned functions, if the input value is greater than or equal to 1.0, saturation should occur to the upper bound, and errno should be set to ERANGE. If the input value is less than 0.0, saturation should occur to the lower bound and errno should be set to ERANGE.

# 5 Programming interface examples

## 5.1 Data type initialization

The following examples show valid and invalid initializations of the SPE data types.

## 5.1.1 \_\_ev64\_opaque\_\_ initialization

The following examples show valid and invalid initializations of ev64 opaque :

Example 1 (Invalid)
\_\_ev64\_opaque\_\_ x1 = { 0, 1 };

This example is invalid because it lacks qualification for interpreting the array initialization. The compiler is unable to interpret whether the array consists of two unsigned integers, two signed integers, four unsigned integers, four signed integers, or two floats.

Example 2 (Invalid)
\_\_ev64\_opaque\_\_ x2 = (\_ev64\_opaque\_\_) { 0, 1 };

This example is invalid because the qualification provides no additional information for interpreting the array initialization.

Example 3 (Valid)
\_\_ev64\_opaque\_\_ x3 = (\_\_ev64\_u32\_\_) { 0, 1 };

This example is valid because the array initialization is qualified so that it provides the compiler with a unique interpretation. The array initialization is interpreted as an ev64 u32 with an implicit cast from the ev64 u32 to ev64 opaque.

Example 4 (Valid)

\_\_ev64\_opaque\_\_ x4 = (\_\_ev64\_opaque\_\_)(\_\_ev64\_u32\_\_) { 0, 1 };

Although this example is the same as Example 3, it includes an explicit cast, rather than depending on the implicit casting to \_\_ev64\_opaque\_\_ on assignment.

Example 5 (Valid)

```
__ev64_opaque__ x5 = (__ev64_u16__) (__ev64_opaque__)
(__ev64_u32__) { 0, 1 };
```

This example shows a series of casts; at the end, the result in x5 is no different from what it would be in Example 3. The example depends on the implicit cast from \_\_ev64\_u16\_\_ to \_\_ev64\_opaque\_\_.

Example 6 (Valid)

```
__ev64_opaque__ x6 = (__ev64_opaque__) (__ev64_u16__)
(__ev64_u32__) { 0, 1 };
```

This example shows a series of casts; at the end, the result in x6 is no different from what it would be in Example 3. The example explicitly casts to \_\_ev64\_opaque\_\_ rather than depending on the implicit cast.

• Example 7 (Valid)

```
_ev64_opaque__x7 = (_ev64_u16__) (_ev64_u32__) { 0, 1 };
```

This example shows a series of casts; at the end, the result in x6 is no different from what it would be in Example 3. The example depends on the implicit cast from \_\_ev64\_u16\_\_ to \_\_ev64\_opaque\_\_.

Example 8 (Valid)

```
__ev64_opaque__ x8 = (__ev64_u16__) { 0, 1, 2, 3 };

This example is similar to Example 3. It shows that any SPE data types except
__ev64_opaque__ can be used to qualify the array initialization.
```

## 5.1.2 Array initialization of SPE data types

The following examples show array initialization of SPE data types:

```
Example 1 shows how to initialize an array of four __ev64_u32__.
   __ev64_u32__ x1[4] = {
      { 0, 1 },
      { 2, 3 },
      { 4, 5 },
      { 6, 7 }
    };
```

• Example 2 shows how to initialize an array of four \_\_ev64\_u16\_\_.

```
__ev64_u16 x2[4] = {
    { 0, 1, 2, 3 },
    { 4, 5, 6, 7 },
    { 8, 9, 10, 11 },
    { 12, 13, 14, 15 },
};
```

Example 3 shows how to initialize an array of four \_\_ev64\_fs\_\_.

```
__ev64_fs__ x3[4] = {
    { 1.1f, 2.2f },
    { -3.3f, 4.4f },
    { 5.5f, 6.6f },
    { 7.7f, -8.8f }
};
```

Example 4 shows explicit casting, and is the same as Example 1:

```
__ev64_u32__ x4[4] = {
  (_ev64_u32__) {0, 1},
  (_ev64_u32__) {2, 3},
  (_ev64_u32__) {4, 5},
  (_ev64_u32__) {6, 7}
};
```

• Example 5 shows mixed explicit casting. x5[1] is equal to (\_\_ev64\_u32\_\_){131075, 262149}.

```
__ev64_u32__ x5[4] = {
  (_ev64_u32__){0, 1},
  (_ev64_u16__){2, 3, 4, 5},
  (_ev64_u32__){6, 7},
  (_ev64_u32__){8, 9}
};
```

## 5.2 Fixed-point accessors

The following sections discuss fixed-point accessors.

## 5.2.1 ev create sfix32 fs

The following examples show use of \_\_ev\_create\_sfix32\_fs:

Example 1

```
__ev64_s32__ x1 = __ev_create_sfix32_fs (0.5, -0.125);
// x1 = {0x40000000, 0xF0000000}
```

The floating-point numbers 0.5 and -0.125 are converted to their fixed-point representations and stored in x1.

• Example 2

```
__ev64_s32__ x2 = __ev_create_sfix32_fs (-1.1, 1.0);
// x2 = {0x80000000, 0x7fffffff}
```

The floating-point numbers are -1.1 and 1.0. Both values are outside of the range that signed fixed-point [-1, 1) supports. Therefore, the results of the conversion are saturated to the most negative number, 0x80000000, and the most positive number, 0x7FFFFFFF.

## 5.2.2 \_\_ev\_create\_ufix32\_fs

The following examples show use of \_\_ev\_create\_ufix32\_fs:

Example 1

```
__ev64_u32__ x1 = __ev_create_ufix32_fs(0.5, 0.125);
// x1 = {0x80000000, 0x20000000}
```

The floating-point numbers 0.5 and 0.125 are converted to their unsigned fixed-point representations and stored in x1.

Example 2

```
__ev64_u32__ x2 = __ev_create_ufix32_fs(-1.1, 1.0);
// x2 = {0x00000000, 0xffffffff}
```

Both floating-point values, -1.1 and 1.0, are outside of the range that unsigned fixed-point [0, 1) supports. Therefore, the results of the conversion are saturated to the lower bound, 0x00000000, and the upper bound, 0xFFFFFFFF.

## 5.2.3 \_\_ev\_set\_ufix32\_fs

The following examples show use of \_\_ev\_set\_ufix32\_fs:

Example 1

```
__ev64_u32__ x1a = { 0x00000000 0xffffffff };
__ev64_u32__ x1b = __ev_set_ufix32_fs (x1a, 0.5, 0);
// x1b = {0x80000000, 0xffffffff}
```

This example shows modification of an element in an SPE variable. The intrinsics work like the create routine in that the floating-point number 0.5 is converted to its unsigned fixed-point representation and placed into element 0.

• Example 2

```
__ev64_u32__ x2a = { 0x00000000 0xffffffff };
__ev64_u32__ x2b = __ev_set_ufix32_fs (x2a, 1.5, 0);
```

```
// x2b = {0xfffffffff, 0xfffffffff}
```

This example shows modification of an element in an SPE variable. The intrinsics work like the create routine in that the floating-point number 1.5 is saturated to the upper bound for unsigned fixed-point representation and placed into element 0.

## 5.2.4 \_\_ev\_set\_sfix32\_fs

The following examples show use of \_\_ev\_set\_sfix32\_fs:

Example 1

```
__ev64_u32__ x1a = { 0x00000000 0xffffffff };

__ev64_u32__ x1b = __ev_set_sfix32_fs (x1a, 0.5, 0);

// x1b = {0x40000000, 0xffffffff}
```

This example shows modification of an element in an SPE variable. The intrinsics work like the create routine in that the floating-point number 0.5 is converted to its signed fixed-point representation and placed into element 0.

• Example 2

```
__ev64_s32__ x2a = { 0x00000000 0xffffffff };

__ev64_s32__ x2b = __ev_set_sfix32_fs (x2a, 1.5, 0);

// x2b = {0x7fffffff, 0xffffffff}
```

This example shows modification of an element in an SPE variable. The intrinsics work like the create routine in that the floating-point number 1.5 is saturated to the upper bound for signed fixed-point representation and placed into element 0.

## 5.2.5 \_\_ev\_get\_ufix32\_fs

This example shows extraction of a floating-point number from an SPE variable interpreted as an unsigned fixed-point number. The intrinsic extracts element 1 of the variable and converts it from an unsigned fixed-point number to the closest floating-point representation.

```
__ev64_u32__ x1 = { 0x80000000, 0xfffffffff };
float f1 = __ev_get_ufix32_fs (x1, 1);
// f1 = 1.0
```

## 5.2.6 \_\_ev\_get\_sfix32\_fs

This example shows extraction of a floating-point number from an SPE variable interpreted as a signed fixed-point number. The intrinsic extracts element 0 of the variable and converts it from a signed fixed-point number to the closest floating-point value.

```
__ev64_s32__ x1 = { 0xf0000000, 0xfffffffff };
float f1 = __ev_get_ufix32_fs (x1, 0);
// f1 = -0.125
```

## 5.3 Loads

These examples apply to load and store intrinsics. All of the examples reference the same 'ev table':

```
__ev64_u32__ ev_table[] = {
    (_ev64_u32__) {0x01020304, 0x05060708},
    (_ev64_u32__) {0x090a0b0c, 0x0d0e0f10},
    (_ev64_u32__) {0x11121314, 0x15161718},
    (_ev64_u32__) {0x191a1b1c, 0x1d1e1f20},
```

```
(__ev64_u32__) {0x797a7b7c, 0x7d7e7f80},
(__ev64_u32__) {0x81828384, 0x85868788},
(__ev64_u32__) {0x898a8b8c, 0x8d8e8f90},
(__ev64_u32__) {0x91929394, 0x95969798}
};
```

## 5.3.1 ev lddx

This example shows indexing of double-word load. The base pointer is set to the address of ev\_table. The intrinsic offsets the base pointer by 2 double-words (16 bytes). This load is equivalent to ev\_table[2].

```
__ev64_u32__ x1 = __ev_lddx((__ev64_opaque__ *)(&ev_table[0]), 16);
// x1 = {0x11121314, 0x15161718};
```

## 5.3.2 \_\_ev\_ldd

This example shows an immediate double-word load. The base pointer is set to the address of ev\_table. The intrinsic offsets the base pointer by 2 double-words. This load is equivalent to ev\_table[2]. The offset in the immediate pointer is scaled by the double-word load size.

```
__ev64_u32__ x1 = __ev_ldd((__ev64_opaque__ *)(&ev_table[0]), 2);
// x1 = {0x11121314, 0x15161718};
```

## 5.3.3 ev lhhesplatx

This example shows an index half-word even splat load. The base pointer is set to the address of ev\_table. The intrinsic offsets the base pointer by 4 bytes.

```
__ev64_u32__ x1 = __ev_lhhesplatx((__ev64_opaque__
*)(&ev_table[0]), 4);
// x1 = {0x05060000, 0x05060000}
```

## 5.3.4 ev Ihhesplat

This example shows an immediate half-word even splat load. The base pointer is set to the address of ev\_table. The intrinsic offsets the base pointer by 4 half-words (8 bytes). Note that the load size, a half-word in this case, scales the offset in the immediate pointer.

```
__ev64_u32__ x1 = __ev_lhhesplat((__ev64_opaque__ *)(&ev_table[0]), 4);
// x1 = {0x090a0000, 0x090a0000}
```

# 6 Glossary of terms and abbreviations

The glossary contains an alphabetical list of terms, phrases, and abbreviations used in this book. Some of the terms and definitions included in the glossary are reprinted from IEEE Std. 754-1985, IEEE Standard for binary floating-point arithmetic, copyright ©1985 by the Institute of Electrical and Electronics Engineers, Inc. with the permission of the IEEE.

Note that some terms are defined in the context of their usage in this manual.

A

**Application binary interface** (ABI). A standardized interface that defines calling conventions and stack usage between applications and the operating system.

**Architecture**. A detailed specification of requirements for a processor or computer system. It does not specify details for implementing the processor or computer system; instead it provides a template for a family of compatible implementations.

В

**Biased exponent**. An exponent whose range of values is shifted by a constant (bias). Typically a bias is provided to allow a range of positive values to express a range that includes both positive and negative values.

**Big-endian**. A byte-ordering method in memory where the address n of a word corresponds to the most-significant byte. In an addressed memory word, the bytes are ordered (left to right) 0, 1, 2, 3, with 0 as the most-significant byte. See Little-endian.

С

**Cast**. A cast expression consists of a left parenthesis, a type name, a right parenthesis, and an operand expression. The cast causes the operand value to be converted to the type name within the parentheses.

D

**Denormalized number**. A non zero floating-point number whose exponent has a reserved value, usually the format's minimum, and whose explicit or implicit leading significand bit is zero.

Е

**Effective address** (EA). The 32- or 64-bit address specified for a load, store, or an instruction fetch. This address is then submitted to the MMU for translation to either a physical memory address or an I/O address.

**Exponent**. In the binary representation of a floating-point number, the exponent is the component that normally signifies the integer power to which the value two is raised in determining the value of the represented number. See also Biased exponent.

F

Fixed-point. (see Fractional)

**Fractional**. SPE supports 16- and 32-bit signed fractional two's complement data formats. For these two N-bit fractional data types, data is represented using the 1. [N-1] bit format. The MSB is the sign bit (-2^0) and the remaining N-1 bits are fractional bits (2^-1 2^-2 ... 2^-(N-1)).

G

**General-purpose register** (GPR). Any of the 32 registers in the general-purpose register file. These registers provide the source operands and destination results for all integer data manipulation instructions. Integer load instructions move data from memory to GPRs and store instructions move data from GPRs to memory.

**IEEE 754**. A standard written by the Institute of Electrical and Electronics Engineers that defines operations and representations of binary floating-point arithmetic.

**Inexact**. Loss of accuracy in an arithmetic operation when the rounded result differs from the infinitely precise value with unbounded range.

L

**LSB** (Least-significant bit). The bit of least value in an address, register, data element, or instruction encoding.

**Little-endian**. A byte-ordering method in memory where the address n of a word corresponds to the least-significant byte. In an addressed memory word, the bytes are ordered (left to right) 3, 2, 1, 0, with 3 as the most-significant byte. See Big-endian.

M

Mnemonic. The abbreviated name of an instruction used for coding.

**Modulo**. A value v that lies outside the range of numbers that an n-bit wide destination type can represent is replaced by the low-order n bits of the two's complement representation of v.

**MSB** (Most-significant bit). The highest-order bit in an address, registers, data element, or instruction encoding.

Ν

**NaN**. An abbreviation for 'Not a Number'; a symbolic entity encoded in floating-point format. The two types of NaNs are signaling NaNs (SNaNs) and quiet NaNs (QNaNs).

**Normalization**. A process by which a floating-point value is manipulated such that it can be represented in the format for the appropriate precision (single- or double-precision). For a floating-point value to be representable in the single- or double-precision format, the leading implied bit must be a 1.

0

**Overflow**. An error condition that occurs during arithmetic operations when the result cannot be stored accurately in the destination register(s). For example, if two 32-bit numbers are multiplied, the result may not be representable in 32 bits.

R

**Reserved field.** In a register, a reserved field is one that is not assigned a function. A reserved field may be a single bit. The handling of reserved bits is implementation-dependent. Software can write any value to such a bit. A subsequent reading of the bit returns 0 if the value last written to the bit was 0 and returns an undefined value (0 or 1) otherwise.

S

**Saturate**. A value v that lies outside the range of numbers representable by a destination type is replaced by the representable number closest to v.

**Significand**. The component of a binary floating-point number that consists of an explicit or implicit leading bit to the left of its implied binary point and a fraction field to the right.

**SIMD** (Single-instruction, multiple-data). An instruction set architecture that performs operations on multiple, parallel values within a single operand.

**Splat**. To replicate a value in multiple elements of an SIMD target operand.

Sticky bit. A bit that when set must be cleared explicitly.

**Supervisor mode**. The privileged operation state of a processor. In supervisor mode, software, typically the operating system, can access all control registers and the supervisor memory space, among other privileged operations.

U

**Underflow**. An error condition that occurs during arithmetic operations when the result cannot be represented accurately in the destination register. For example, underflow can happen if two floating-point fractions are multiplied and the result requires a smaller exponent and/or mantissa than the single-precision format can provide. In other words, the result is too small for accurate representation.

**User mode**. The unprivileged operating state of a processor used typically by application software. In user mode, software can only access certain control registers and can access only user memory space. No privileged operations can be performed. Also known as problem state.

٧

**Vector literal**. A constant expression with a value that is taken as a vector type.

W

Word. A 32-bit data element.
